JOHN NIGEL STARK, consulting surgeon to the Royal Samaritan Hospital for Women, Glasgow, died at his home, Murrayfield Gardens, Edinburgh, where he lived after retirement from active practice in 1928 and travelling abroad. Dr. Nigel Stark received his medical education at the University of Edinburgh, graduating M.B., C.M. in 1884, and proceeded to the M.D. (with commendation) in 1900. He was elected a Fellow of the Royal Faculty of Physicians and Surgeons of Glasgow in 1890, after his appointment as assistant obstetric physician to the Glasgow Royal Maternity and Women's Hospital and assistant surgeon to the Royal Samaritan Hospital. Dr. Nigel Stark was a Fellow of the Edinburgh Obstetrical Society and had been president of the Glasgow Obstetrical and Gynaecological Society. He joined the B.M.A. in 1888. He was the author of *An Obstetric Diary of William Hunter, 1762-1776 with Notes*, published in 1909.

Dr. WILLIAM FOGGITT CHRISPIN of Castleford, Yorks, who has died at the age of 80, practised in that town for 44 years until his retirement in 1942. He studied medicine at Leeds and took the L.S.A. in 1898, and when the title of the diploma was changed became L.M.S.S.A. in 1907. Dr. Chrispin had a long career in public service: he was M.O.H. for Castleford for 12 years and later was a member of the urban council for 9 years, and chairman in 1936-7. Since 1930 he had been a justice of the peace and took his place regularly on the Castleford Bench until a few weeks ago; he was also a church warden for many years, serving altogether under five rectors. He joined the B.M.A. in 1905 and remained a member until he gave up active work.

Dr. M. J. Fenton writes: In the *Journal* seventeen years ago (1926, 2, 548) Dr. ERIC PRITCHARD wrote: "Exactly the same feeding [i.e., as given to his first child] had fatal consequences in the case of my second child—through no fault of the laboratories, but solely owing to my own incompetence—and it was that never-to-be-forgotten experience that determined me to devote my life to a study of the means of obviating such disasters in the future." The devotion and the study the late Dr. Eric Pritchard gave to this subject brought untold pleasures to the world at large and to mothers in particular. Another instance of the profession's gifts to mankind through personal experience.

We regret to announce the death of Dr. EDWARD WILLIAM DACRE HARDY, M.C., consulting anaesthetist to the Royal Victoria and West Hants Hospital and to the Hants and Bournemouth Children's Clinics. He was born on July 7, 1878, son of Dr. W. G. Hardy of Bournemouth, and from Haileybury College went up in 1897 to Christ's College, Cambridge, and thence for his clinical course to St. Bartholomew's Hospital. After qualifying M.R.C.S., L.R.C.P. in 1906, he was house-surgeon at the Royal Berks Hospital at Reading, and then returned to Bournemouth to take up general practice with anaesthesia as a specialty, which occupied more and more of his time. His first appointments at the Royal Victoria and West Hants Hospital were those of anaesthetist, junior assistant physician, and registrar. During the war of 1914-18 he served in the R.A.M.C. with the temporary rank of captain and was

awarded the Military Cross. Dr. Hardy joined the B.M.A. in 1917, was chairman of the Bournemouth Division in 1925-6, and vice-president of the Section of Anaesthetics at the Bournemouth Annual Meeting of 1934, serving also on the Local General Committee. More than a year ago he had to give up practice owing to ill-health. He was a most kindly and charming companion and an all-round sportsman. He enjoyed lawn tennis, swimming, golf, sailing, and fishing, and bred wire-haired fox terriers.

The following appreciation of Mr. JOHN LEVIS comes from Dr. C. E. S. Flemming: The first thought at the news of the death of John Levis must have been one of deep grief at the loss of a great friend, a loss seemingly irreparable not only to ourselves but to the profession, the hospitals he worked for, and the public throughout a large district. Medical men, patients and friends, and the public each and all obviously felt how great had been their loss. Simplicity and absolute sincerity, invariable good temper, native Irish humour and kind words, unselfishness, never failing to help when wanted, and the success of his work—all these inspired great respect and a very real affection. It was not only patients but the medical profession who valued his skill in diagnosis and treatment, for the demand on his services was great and the work he did must have been prodigious. I remember, about four years ago, that after a visit to a meeting of surgeons in Paris and then a hard day's operating in Trowbridge Hospital he was so tired that when driving home he felt ill and could not go on till someone found him in his car and had him driven home. A memorial service in Trowbridge Parish Church, which was filled with old patients and friends and all the medical men of the district, was a striking evidence of the feelings of the public towards what the local newspaper called "a beloved surgeon." His great success as a surgeon must have been largely due to the high esteem in which his work was held by his colleagues, for he spoke little at meetings and wrote hardly at all.

The following appreciation of Dr. W. BURTON WOOD comes from T. H. S.: Those who knew Burton Wood can only regret that contact with this generous and stimulating personality was not more widespread. A philosopher in the widest sense of the term, his conversation left his hearers with a feeling of profound benefit and satisfaction that was derived from a rare blend of wisdom and humour. Wider audiences will recall his lectures and addresses with lively gratitude, and patients will realize how much they owed to the personality and advice of the physician. His approach to chest work was essentially conservative, but as soon as a good case could be fully made out for any radical change in treatment his support and encouragement were unfailing. His illness over the last few years depicted the man he was: an omnivorous reader and thinker, a writer of fascinating letters, an optimistic though no visionary builder for the future. His was truly a spirit for which death could not spell "finis."

An obituary notice of Mr. GEORGE COWEN, M.S., F.R.C.S., appeared in the *Journal* of Nov. 13. Dr. R. Vaughan Thomas writes from Birkenhead: As an old senior house-surgeon at the Royal South Hants Hospital, Southampton, may I be allowed to pay a tribute to his memory. He was much beloved and respected by staff and patients alike. By nature kind and gentle, unassuming and possessing a keen sense of humour, ever ready to lend a helping hand to a timid and hesitant house-surgeon, he helped many along surgical paths. An indefatigable worker, a most thorough and profound clinician, and a dexterous operator, he would have been an asset to any teaching school. His surgical skill and knowledge knew no bounds; he was master of his art in any branch of surgery. His knowledge was founded on a wealth of clinical experience, gathered over many years by his long association with the two hospitals at Southampton. Mr. Cowen represented in every sense the finest type of British provincial surgeon. He was one whom it was an honour and a privilege to serve. He will be long remembered with affection by many who had the good fortune to work with him at Southampton.

We regret to announce the death of Dr. ROBERT LINDSAY, to whose memory a colleague sends the following tribute: One who, by his cultured mind, courage, devotion to duty, and modesty, did much to maintain the respect in which our profession is held died at Southport on Nov. 4 in the person of Dr. Robert Lindsay of Cupola House, Folkestone. He was first in the open bursary list when he entered the University of Glasgow from Kilmarnock Academy in 1908. Before commencing the study of medicine he had taken the M.A. with honours in classics. He had many distinctions in medicine. Graduating M.B., Ch.B. in 1916 he immediately entered the R.A.M.C. and

saw service in Mesopotamia and in France, being medical officer with the 1st Battalion of the Grenadier Guards at the signing of the Armistice. He started practice in Radcliffe, Lancashire, in 1920, but in 1935 his health broke down and he had to give up work for eighteen months. On his partial recovery he took up practice in Folkestone, hoping that limited activity in the mild climate of the south would help him to recover his strength. Though he was unfit when war broke out, he refused to leave Folkestone, where he felt his duty lay. For repeated acts of gallantry he was awarded the George Medal in 1940. Six months ago he had an acute exacerbation of his illness and from this he never recovered. Robert Lindsay retained his early love of Latin and Greek and was an accomplished classical scholar. He was the kindest-hearted of men and the warmest of friends, and he was fortunate in finding great happiness in his home. His modesty prevented him from exploiting his brilliant gifts as he could, perhaps should, have done. To his devoted wife, his son, who is a student of medicine, and his daughter we offer sincere sympathy.—D. C.

Many members will learn with regret of the death of Mr. S. COULSON, who was chief clerk of the British Medical Association from 1908 until he retired on account of ill-health in 1937. Mr. Coulson rendered loyal and efficient service to the medical profession as the senior member of the clerical staff of the Secretarial Department for so many years.

Dr. Philip A. Maplestone writes from Lachlan Park Hospital, New Norfolk, Tasmania: I received to-day the issue of the *Journal* dated May 8 in which are some tributes to the late Prof. WARRINGTON YORKE, hence this somewhat belated communication. There is an important aspect of his career and of his character that does not seem to have been appreciated, and one that I think should be placed on record. If one glances through the publications of those numerous workers (including myself) who collaborated with him, I think it will be agreed that in many instances their best work has been done while in association with him. This occurs too often to be a coincidence, and although, with his typical fair-mindedness, he would never admit this to me, I think it is clear to many of us who were fortunate enough to have worked in his company that we, to a large extent, owe such successes as we have later achieved to this association.

Medical Notes in Parliament

Royal Commission on Birth Rate

Mr. ATTLEE announced on Dec. 1 that the Government had decided to set up a Royal Commission to investigate the birth rate and trends of population, and that Lord Simon, the Lord Chancellor, had accepted the chairmanship. Other members of the Commission would be announced as soon as practicable. Their terms of reference would be: "To examine the facts relating to the present population trends in Great Britain; to investigate the causes of these trends and to consider their possible consequences; to consider what measures, if any, should be taken in the national interest to influence the future trend of population; and to make recommendations."

The Government had also decided to set on foot immediately a number of inquiries of a technical kind, the scope and character of which would be determined in consultation with the chairman of the Commission. The results would be made available to the Commission as soon as possible. It was expected that in the meantime the Commission would find it practicable to explore and to take evidence upon more general issues connected with the subject. Inclusion in the Commission of a housing expert would be considered. Mr. Attlee hoped that the Commission would report as quickly as it could.

Forthcoming White Paper

During the debate on the address in reply to the King's speech in the House of Commons on Nov. 30, Sir HENRY MORRIS-JONES said that there was no mandate from the country with regard to a State Medical Service. He doubted whether in time of peace any Government could possibly introduce legislation of such an immense character without securing a mandate beforehand. He was glad that the King's speech referred to proposals which would come before the House for discussion. Whatever shape or form it might take, such a scheme would mean great evolutionary and revolutionary changes in the country affecting everyone. It was only right that before submitting legislation to the House the Government should wish to hear the feelings and desires of the House and the country in regard to such a great reform.

Mr. LYTTELTON, in reply, said he quite understood that the House might be impatient on the subject of the social security scheme. He would have been so himself if he had not been a member of a Ministerial committee which had to deal with that question. The complexity of it had to be seen to be believed. If they took part of it, say workmen's compensation or the comprehensive medical service, they would become involved in administrative problems of the very greatest difficulty, requiring not only an encyclopaedic knowledge of the background, but very great administrative experience in solving present problems. The bulk of the problem had been tackled. The White Paper was now being drafted, and would be laid before Parliament. It would show that the Government had very definite proposals over a large part of the field, but that there were some subjects on which they were undecided and wished to take the opinion of members and to make soundings. He saw nothing reprehensible in that. Did anyone realize that a matter like the comprehensive medical service involved altering the number of those entitled to a comprehensive medical service from 18,000,000, the present insured population, to the whole population of 44,250,000?

Patulin

In an answer to Colonel Evans on Dec. 2 Miss HORSBROUGH referred to recent trials of the use of patulin. She said the Medical Research Council had accepted an invitation to undertake the organization of controlled clinical trials on a considerable scale. Arrangements were in hand for instituting these immediately. For the time being the use of patulin in the treatment of the common cold must be regarded as still in the experimental stage. Preliminary trials had not given consistent results, although some of these had been promising. It was uncertain what value the drug would eventually prove to have. It would necessarily take some months to collect adequate information on this point, and as regards the best methods of administration, the proper dosage, and the conditions under which the drug could be used with safety. It would be inadvisable to take steps to make patulin generally available until there was sufficient evidence on these questions.

Medical News

The Nuffield Provincial Hospitals Trust, at Lord Nuffield's suggestion, has offered the University of Oxford £8,000 a year for ten years towards the cost of establishing and maintaining a plastic surgery unit in the University of Oxford. The University has accepted with gratitude the offer of the Trust and has appointed Mr. T. Pomfret Kilner, F.R.C.S., as the first director of the plastic surgery unit with the title of Nuffield Professor of Plastic Surgery. The Radcliffe Infirmary will provide hospital facilities for the unit, and these will be supplemented by the Ministry of Pensions.

Prof. T. P. McMurray will open a discussion on "The Late Problems of War Surgery" at a clinical meeting to be held at 2.30 p.m. on Dec. 16 in the Ministry of Pensions Hospital, Woolton Road, Liverpool, 16.

Mr. R. Watson-Jones will speak on "A Surgeon's Impressions of Soviet Russia" at the annual general meeting of the Anglo-Soviet Medical Council on Friday, Dec. 17, at 4.30 p.m. at the Royal Society of Medicine.

A meeting of the Fever Hospital Medical Service Group will be held at Tavistock House, Tavistock Square, London, W.C.1, on Friday, Dec. 17, at 3 p.m., preceded by a meeting of the Group Council at 2.30 p.m. Subject for discussion: "Control of Cross-infection"; to be opened by Dr. R. B. Bourdillon, Dr. Joyce Wright, and Dr. H. Stanley Banks.

At the Royal Society of Medicine on Dec. 15, at 2 p.m. for 2.15 p.m., the Section of Comparative Medicine will hold the second of its discussions under the heading of "The Limitations and Uses of the Comparative Method of Medicine." The subject on this occasion will be animal ecology and genetics; openers: ecology, M. A. C. Hinton, F.R.S.; genetics, Dr. H. Grüneberg.

The Agricultural Group of the Society of Chemical Industry will meet on Tuesday, Dec. 14, at 4 p.m. in the rooms of the Chemical Society, Burlington House, Piccadilly, W., when a paper on livestock deficiency diseases and their treatment will be presented by Dr. S. J. Watson, Director of Research, Jealotts Hill Research Station.

The following meetings of the British Institute of Radiology will take place in the Reid-Knox Hall, 32, Welbeck Street, London, W.: Friday, Dec. 17, at 2.30 p.m., meeting of medical members. Saturday, Dec. 18, at 2.30 p.m., ordinary meeting, at which papers will be read on chronic intussusception in children by Dr. F. H. Kemp, and on instantaneous stereography by G. L. Rogers, Ph.D.

At a meeting of the Eugenics Society on Tuesday, Dec. 14, at 5 o'clock, at the rooms of the Royal Society, Burlington House Piccadilly, W., Dr. J. A. Fraser Roberts will speak on "Population Problems in the Light of Differential Fertility." All interested in the subject are invited to attend.

The Finney-Howell Research Foundation announces that applications for fellowships for next year must be filed in the office of the Foundation, 1211, Cathedral Street, Baltimore, Maryland, by Jan. 1, 1944. Applications received after that date cannot be considered for 1944 awards, which will be made on March 1. The Foundation was provided for in the will of the late Dr. George Walker of Baltimore for the support of "research work into its cause or causes and the treatment of cancer." Fellowships, carrying an annual stipend of \$2,000, are awarded for the period of one year with the possibility of renewal up to three years; special grants of limited sums may be made by the Board of Directors to support the work carried on under a fellowship. Application forms will be furnished by the secretary or any member of the Board.

An American-Soviet Medical Society has been founded in New York to meet an increasing demand for information about its results and achievements of Soviet medicine. The president of the society is Dr. Walter B. Cannon, emeritus professor of physiology at Harvard University; and Dr. Henry E. Sigerist, director of the Institute of the History of Medicine, Johns Hopkins University, is the editor of its journal, *The American Review of Soviet Medicine*. The temporary offices of the society are at 130, West 46th Street, New York City.

Service medical officers in this country are to be allowed, so far as their military duties permit, to help civilian doctors during the present epidemic. Hard-pressed general practitioners needing help are advised to apply to the secretary of their local Medical War Committee forthwith.

Universities and Colleges

UNIVERSITY OF OXFORD

In a Congregation held on Nov. 20 the following medical degrees were conferred:

B.M., B.Ch.—J. Badenoch, *A. H. Torrance.
*In absentia.

UNIVERSITY OF CAMBRIDGE

At a Congregation held on Nov. 19 the following medical degrees were conferred:

M.D.—J. B. Murray, *D. D. Evans, *E. T. D. Fletcher.
M.B., B.Chir.—*F. M. Delington.
*By proxy.

The Services

Major (temp. Lieut.-Col.) R. McL. Gordon, D.S.O., D.F.C., R.A.M.C., has been awarded the George Medal in recognition of gallant conduct in carrying out hazardous work in the Middle East in a very brave manner.

Lieut. B. Browncombe, R.A.M.C., has been awarded the George Medal in recognition of conspicuous gallantry in carrying out hazardous work in a very brave manner.

The following appointments, awards, and mentions have been announced in a *Supplement* to the *London Gazette* in recognition of gallant and distinguished services in the Middle East:

C.B.E. (Military Division).—Brig. (temp.) R. W. Galloway, I. R.A.M.C.

O.B.E. (Military Division).—Cols. (temp.) F. R. H. Mollan, M.C.; J. G. Morgan; Lieut.-Col. R. MacL. Savege, M.C.; Majors (temp. Lieut.-Cols.) C. W. Arnot, M.C., D. W. Jolly, A. N. B. Odbert, P. J. Richards, H. S. Ward, R.A.M.C.

M.B.E. (Military Division).—Capt. (temp. Major) A. J. C. Latchmore, R.A.M.C.; Subedar M. Singh, I.M.D.

M.C.—Capt. D. Rumney, R.A.M.C.

Mentioned in Dispatches.—Capt. E. F. Ridley, R.A.M.C.

CASUALTIES IN THE MEDICAL SERVICES

Wounded.—Temp. Lieut.-Col. M. J. Kohane, M.C., R.A.M.C.; Temp. Acting Surg. Lieut.-Cmdr. S. W. Maxwell, R.N.V.R.

Prisoners of War.—War Subs. Capt. F. E. de W. Cayley, Capt. R. M. J. Franks, War Subs. Major A. C. King, Capt. J. Ledingham, Acting Major T. M. Pemberton, War Subs. Capt. J. Richardson, War Subs. Capt. P. G. Seed, and Temp. Lieut.-Col. J. H. Strahan, R.A.M.C.

Reported Missing.—Surg. Lieut. R. McF. Kirkpatrick, R.N.V.R.
Died on Active Service.—Major W. H. Purves, M.B.E., R.A.M.C.

EPIDEMIOLOGICAL NOTES

Influenza

The returns for the week ending Nov. 27 show another large rise in the deaths from influenza in the 126 great towns—375 as compared with 106 in the week ending Nov. 20 and 46 in the week ending Nov. 13. In the week corresponding to that ending Nov. 27 in the six previous years the number of influenza deaths varied between 25 and 52. The notifications of acute pneumonia (including primary and influenzal) during the six weeks up to and including week ending Nov. 27 were: 579, 576, 676, 781, 978, 1,647.

Discussion of Table

In England and Wales during the week scarlet fever notifications fell by 138, those of diphtheria by 114, and those of whooping-cough by 36. The incidence of measles remained at the same level for the third consecutive week. There were 197 more cases of acute pneumonia, and 18 more of dysentery.

There was less scarlet fever in the North; in the South the situation was unchanged. The rise in pneumonia and the fall in diphtheria were general throughout the country. There was much variation in the local trends of whooping-cough; the largest decreases were in Yorks West Riding by 53 and in Staffordshire by 30; the greatest increases were in Derbyshire by 34 and in Lancashire by 32 cases.

There was no fresh outbreak of dysentery, the increase being due to small-rises in existing centres of infection. The largest totals were in London 49, Middlesex 23, Kent 16, Lancashire 13, Yorks West Riding 11. After a week's interval a further 8 cases were reported from Bedfordshire, Biggleswade R.D.

In Scotland notifications of scarlet fever were down by 47, of dysentery by 28, of measles by 19; primary pneumonia was up by 39 and whooping-cough by 13. On Nov. 30 Mr. Johnston informed Mr. McNeil that notifications of cases of pulmonary tuberculosis between June 1 and Nov. 1, 1943, were 3,073. The corresponding figures for the same period in 1942 was 2,633; in 1941, 2,361; and in 1940, 2,118.

In Eire notifications of diphtheria rose by 18, and those of whooping-cough by 40. Whooping-cough was concentrated in five areas, where 52 of the 61 cases were reported.

Smallpox

A case of smallpox and 2 suspected cases were removed from a ship at a West of Scotland port. A conference of health authorities was held, and all necessary steps to organize precautions were taken. The 3,000 passengers were moved to an isolation centre, to be detained there for fourteen days. The patient, a soldier aged 23, is stated to be improving, and the suspects have been found not to suffer from the disease. No further developments are expected.

Scotland's Health

Dr. Andrew Davidson, Chief Medical Officer of the Department of Health for Scotland, stated at a recent Press conference that the nation's health at the beginning of the fifth winter of hostilities was surprisingly good, but that there was no lack of health problems. The incidences of tuberculosis, of infant mortality, and of venereal diseases have risen since 1939. A recent inquiry among the insured population showed that, although the incidence of sickness had risen sharply, there was a remarkable drop in the average duration of sickness for both males and females. The biggest of the immediate problems was tuberculosis, which had risen by 17% during the war. But for the shortage of nurses and domestic staff, 300 more beds could be put into commission. The waiting list for treatment has doubled during the past year, and about 1,000 pulmonary and 200 non-pulmonary tuberculosis patients were on the list. Dysentery of a mild type had increased since the war. Diphtheria mortality had fallen following the campaign for immunization; but there were still nearly half a million children unprotected, and unless a sense of urgency in prevention could be maintained there was a danger of losing the benefits they had already achieved.

The Week Ending November 27

The returns of the notifications of infectious diseases in England and Wales during the week included: scarlet fever 3,157, whooping-cough 1,800, diphtheria 732, measles 518, acute pneumonia 1,647, cerebrospinal fever 43, dysentery 147, paratyphoid, 2. The deaths from influenza in the 126 great towns numbered 375.

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Nov. 20

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included), (b) London (administrative county), (c) Scotland, (d) Eire, (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease are for: (a) The 126 great towns in England and Wales (including London) (b) London (administrative county), (c) The 16 principal towns in Scotland, (d) The 13 principal towns in Eire, (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

* Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

† Includes puerperal fever for England and Wales and Eire.

‡ Owing to evacuation schemes and other movements of population, birth and death rates for Northern Ireland are no longer available.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Secretary of the Journal Board, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. If reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager (hours 9 a.m. to 5 p.m.). Members' subscriptions should be sent to the Secretary of the Association.

TELEPHONE NO.—B.M.A. and B.M.J.: EUSTON 2111.

TELEGRAPHIC ADDRESSES—EDITOR, *Alliology Westcent*, London; SECRETARY, *Mediscera Westcent*, London.

B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

ANY QUESTIONS?

Influenza

Q.—I would be grateful for any suggestions on the prevailing epidemic of influenza, in which the predominant symptoms are pyrexia, hyperpyrexia, petechial haemorrhages of uvula, palate, and fauces, persistent cough, sometimes with moisture in lungs. Is this true influenza, 1918-19 type? If so, what is the line of treatment?

A.—In their studies of epidemic influenza in 1936-7, much of which was due to influenza virus A, Stuart-Harris and his colleagues¹ recognized three clinical forms of the infection: simple influenza, influenza with bronchiolitis, and influenzal pneumonia. A typical case of simple influenza began suddenly with headache, followed by shivering, aches in the limbs and back, and a short, dry, persistent cough; temperature rose quickly to 102°-103° F., and by the second day the infection was at its height with severe headache, muscular pains, glistening injected throat, and upper respiratory symptoms. By the fifth day temperature was normal; the patient was rather weak, but was fit for discharge by the ninth or tenth day. In influenza with bronchiolitis, the pulmonary symptoms (rales and rhonchi, particularly at the bases) dominated the picture; the patient was more ill, with some cyanosis, and pyrexia lasted longer, sometimes with a short afebrile interlude. The chest signs either accompanied the initial fever or were associated with a secondary relapse.

In the third group with pneumonia the consolidation might develop with surprising rapidity—the typical influenzal pneumonia which was common in the 1918 pandemic—or it occurred as a post-influenzal complication. The early influenzal pneumonia is characterized by the so-called "heliotrope" cyanosis, abundant frothy (sometimes blood-stained) spit, physical signs of a bronchiolitis or basal pneumonia, and in severe cases a rapid worsening of the patient's condition, with death within 2 to 3 days. It is not yet known whether this pneumonia is due to the virus itself or to a secondary bacterial invader. The post-influenzal pneumonias are mostly caused by bacterial infection; the staphylococcus, haemolytic streptococcus, Pfeiffer's bacillus, and the pneumococcus have all been incriminated, one or other of them usually being predominant in outbreaks in different localities, which suggests a case-to-case spread of these organisms.

The symptoms described in the question would fit either simple influenza or influenza with bronchiolitis, but for absolute proof that an illness of this kind is "epidemic influenza" either influenza virus must be isolated from the patient's throat or the appearance of specific antibody in the patient's blood must be demonstrated. As

with epidemic influenza virus A is now being found in parts of the country, the chances are that the condition is influenza. However, febrile catarrhs (not due to an virus) and atypical pneumonia may give a somewhat similar

In the latter infection x-ray examination usually reveals a characteristic picture and "cold-agglutinins" develop in the patient's blood.

The treatment of influenza is early confinement to bed, preferably at home, with full ventilation of the room, alleviation of the presenting symptoms with appropriate remedies, and a careful convalescence. The sulphonamide drugs have no effect on the primary virus infection, but should be used at the first signs of a secondary bacterial complication.

Chronic Pancreatitis

Q.—Fourteen months ago a man aged 53 became deeply jaundiced, with some attacks of abdominal pain. Six months after its onset a cholecystgastrostomy was performed, and at this time no apparent neoplasm of the pancreas was found. The diagnosis previously made had been carcinoma of the head of the pancreas. The pancreas was, in fact, diffusely hardened with some nodular formation. Some such nodule apparently had caused occlusion of the bile-duct by

¹ *A Study of Epidemic Influenza*. M.R.C. Spec. Rep. Ser., No. 228, London, 1938.

direct pressure. No section was taken for biopsy. Nothing abnormal in the liver. Jaundice disappeared, and with it the steatorrhoea and icterus, etc., but after three months the clay-coloured stools returned, and this has since persisted. Three months ago the patient developed sternal pain of gradually increasing severity, accompanied by much vomiting of bile-stained fluid and undigested food. On admission to hospital he was dehydrated and wasted. There was complete duodenal stenosis, and a gastro-jejunostomy was performed. Stomach greatly distended, but again no evidence of neoplasm in the abdomen. The pancreas still presented the same nodular hard thickening, but the cause of the duodenal obstruction was not discovered; it was apparently due to some form of mechanical kinking and/or pressure of the hardened pancreas. This operation was followed by rapid amelioration of symptoms, and the patient made a good recovery. Just before his discharge, weight 6 stone, however, an accidental blood-sugar estimation revealed a figure of 0.392 mg. per 100 c.cm., and he was put on insulin soluble 5 units twice daily. His present weight is 8 st. 7 lb. Is this a true case of chronic pancreatic fibrosis, to what would you attribute his present steatorrhoea, and what treatment, if any, would you suggest? His intense hunger soon after quite a good meal is, I presume, a diabetic symptom accompanied by the effects of rapid gastric emptying following the gastro-jejunostomy.

A.—The question asks for diagnosis at a distance, which is not a procedure to be encouraged. In any event the differential diagnosis between carcinoma and chronic inflammation of the pancreas may often be almost impossible during life. The sequence of events is clearly related to the effects of pressure by the indurated pancreas (biliary and duodenal obstruction), and to the disturbance of pancreatic function (hyperglycaemia and steatorrhoea). The intense hunger after meals is more likely to be due to faulty absorption of fat and protein than to the hyperglycaemia or rapid gastric emptying. The length of the history suggests that this is a case of chronic fibrosis of the pancreas, but the possibility of a slowly infiltrating neoplasm must still be considered. Was a biopsy taken at the time of the operation? X-ray examination for pancreatic calculi might also be of value, and it would be of interest to know the fat and nitrogen content of the stools, the diastase content of the urine, and the blood count. Treatment is difficult, but the regime prescribe for sprue—namely, a high-protein and low-fat diet with parenteral administration of liver extract—might be worth a trial. At the same time the caloric content of the diet should be as high as possible in order to restore the normal weight.

Lactation and Hormones

Q.—With further reference to the treatment of small breasts in multiparous woman dealt with on July 25 and Sept. 4, can one attempt any treatment for that condition in a patient who is already pregnant, in order to improve the chances of breast-feeding? In the two previous pregnancies breast-feeding was started and then severed with, but eventually had to be abandoned. There appeared to be quite a fair secretion of milk, but a great deal was lost between feeds, apparently through too small a "storage capacity." Pregnant is now in the fifth month.

A.—The mechanism of milk production is almost certainly not a factor of the oestrogenic stimulation of the breast such as was discussed in the original questions. Lactation is probably due to the release of lactogenic hormone of the anterior pituitary by means of a sort of trigger-action, admittedly acting on breasts which are already primed by the relatively large quantities of oestrogens and progestogens which are circulating in the blood stream during pregnancy. It is therefore unlikely that the apparently limited "storage capacity" of the breasts is due to the insufficient exhibition of oestrogen and progestogen during pregnancy. At parturition the breasts have every opportunity of being fully stimulated by oestrogen and progestogen. Inadequate milk-yields in the puerperium may be due to ineffective lactogenic stimulation, and the administration of lactogenic hormone has been reported to be effective in some cases. Inadequate storage does not, however, seem to be a condition which can be treated by endocrine therapy. Administration of oestrogen would, if anything, tend to decrease the milk secretion, and it has not been suggested that progestogen increases the milk storage capacity of the breasts. One of the most important factors in maintaining adequate lactation is, of course, efficient suckling.

Measuring Surface Area

Q.—What is the formula connecting stature (sole-vertex length and surface (skin) area in a normal human being? Would it be applicable to the foetus with expectation of trustworthy result? Could such surface-length formula be correlated with that for right-cylindrical-surface area = $2\pi R \cdot L$, where R = radius of base and L = length?

A.—For a spherical body, taking L to represent any linear dimension and W to represent the weight, we can write surface area (S.A.) = $k_1 L^2$ and $W = k_2 L^3$, whence $S.A. = K \sqrt{W}$. But this is no satisfactory formula connecting sole-vertex length and S.

the human being. "Normal" human beings are of very different builds and definite body types are recognized. A tall thin man and tall robust man have very different S.A.s, but both men are "normal" for particular body types. Delafield Du Bois attempted to overcome these difficulties by introducing the so-called "linear formula," which treats separate parts of the body as approximations to cylinders. Lengths and circumferences of different parts are measured and the areas calculated. The sum of the separate areas of the parts gives the surface area of the body. The error, as judged by comparison with direct measurement of S.A., is $\pm 2\%$ in cases which included a baby, a tall thin man, and "a short, almost lobular, woman."

The better-known formula of E. Du Bois— $S.A. = W^{0.725} \times H^{0.725}$ —takes different body builds into account by making an allowance for weight. The simplest formula relating S.A. and otheromatic measurements is that suggested by Meeh— $S.A. = 12.3 \times \sqrt{W}$, although more recent authorities regard the constant as being too high. Using Dreyer's formula, which relates W to trunk length, $V = 0.38025 \times 0.319 \sqrt{L}$, where L = trunk length, S.A. can be related to trunk length. For the foetus, Lissauer's modification of the Meeh formula is $S.A. = 10.3 \times \sqrt{W}$, and Scammon gives $W = (0.26L)^{1.034}$, where W = weight (g.) and L = crown-heel length (cm.). L can also be estimated according to the age of the foetus from $T = 2.3 + \frac{2.5L}{78}$, where T = menstrual age in lunar months. The Du Bois height-weight formula is usually taken to be applicable to the foetus. No simple application of the right-cylinder formula would be applicable except in the way used by D. Du Bois, once differentiation of form had commenced in the foetus.

I. Sandiford (*J. biol. Chem.*, 1924, 62, 323) gives useful graphs relating age, height, length, and S.A. for the foetus, and J. Needham (*Chemical Embryology*, Vol. I, Part III) gives much information about the rate of growth.

Umbilical Hernia

Q.—I have been perturbed in my midwifery practice by the apparently high incidence of umbilical hernia in the newborn. An unhelpful reference in a textbook to "errors in technique of dealing with the cord" has only served to worry me further. Is there any reason to suppose that umbilical hernia may be prevented by killed handling of the cord? If so, what are the principles to be followed?

A.—When every care is taken to avoid traction on the cord during the birth of a child and during the time of ligation before dividing the cord, it is still not uncommon to find umbilical hernia occurring when the infants are examined either before departure from hospital or a week or two later, when the mother reports for post-natal examination. There would seem, therefore, to be a considerable incidence of hernia irrespective of the care used at birth. Most of these cases, however, can be satisfactorily treated if from the earliest days any attempt at protrusion of the umbilical stump is overcome by padding a penny and using it as a splint. It can be kept in place by adhesive tape or a binder.

Koilonychia

Q.—A woman aged 45 has had atrophic hollowed nails for the past year. What are the aetiology and treatment of this condition?

A.—The commonest cause of atrophic hollow nails (koilonychia or spoon nails) in a female of 45 is iron deficiency. This will probably be associated with other signs of iron deficiency, such as hypochromic anaemia, angular stomatitis, glossitis, or dysphagia. The predisposing cause may be menorrhagia, and gross lesions such as ibroids should be excluded. Treatment is by iron by mouth—e.g., *ab. ferri sulph.* gr. 3 t.d.s., p.c., or *mist. ferri et ammon. cit.* N.W.F., 1/2 oz., q.d.s., p.c. Koilonychia is always aggravated by manual work, and it may occur as an occupational disease unassociated with iron deficiency in those who handle strong acids and alkalis, chemical glues, etc. A rare familial and hereditary form of koilonychia has also been described.

Sulphonamides for Bronchiectasis

Q.—Has sulphonamide therapy been of any value in the treatment of bronchiectasis—or alternatively the use of autogenous vaccine? One case which has prompted this question has typical sputum showing a mixed flora of *Micrococcus catarrhalis*, *diphtheroids*, and scanty *streptococci* and *pneumococci*. Operation cannot be considered.

A.—Whether bronchiectasis can be alleviated by any such measures depends on the nature of the lesion and in particular on whether the bronchial mucosa is intact or destroyed. In advanced sacular bronchiectasis with cavities lined only by granulation tissue it is obviously hopeless to expect that efforts to eliminate infection will have any permanent effect. "Typical" sputum in this form of the disease is purulent, liquid, and usually foul-smelling, with a mixed flora, including anaerobes. In the type with an intact mucosa it consists

of muco-pus which is not offensive, and usually contains only a single micro-organism—often *H. influenzae*—in significant numbers. It is not clear from the question to which category this case belongs, or what significance to attach to the sputum findings.

The sulphonamide treatment of chronic infections is in general less satisfactory than that of acute, but a course of, for example, sulphadiazine (1 g. 5 times daily for a week) would be worth trying if the organism mainly responsible were of a susceptible species, such as a pneumococcus. The possible success of an autogenous vaccine is also conditional on identifying a causative organism from which it can suitably be made, and from the information given any decision made on this point in this case would appear to be dubious.

Insulin Lipodystrophy

Q.—What is the cause of insulin lipodystrophy? How can it be prevented? I have two patients under treatment who have developed it. Both are severe diabetics. One is a girl aged 15 who has developed it both with soluble and zinc-protamine insulin. The other is a woman aged 45 who is having injections of soluble insulin.

A.—The exact cause of insulin lipodystrophy is not known. Clinical observation relates it to the giving of many injections of insulin in one small area. This, however, is a common practice in diabetics, and only a minority of those who indulge in it get this trouble. There must therefore be another factor in the matter making for sensitivity. It does appear now quite clear that infection and preservatives do not enter into the question, nor does the purity of the insulin, because it has been observed in crystalline insulin solutions. There is, however, an impression that it is less frequent with protamine insulin than with ordinary insulin. If no further injections are given anywhere near the affected area it can be expected that in two to four years the condition will disappear. In the management of the case, therefore, the physician should draw up a map of the body, and he should indicate on it the situations where insulin should be injected on the different days (remembering that insulin can be injected into any part of the body that is not covered with hair). No injections should be put anywhere near the affected part.

Greatest Age of Conception

Q.—What is the greatest recorded age at which conception has taken place? Does the law accept a limit to the child-bearing age?

A.—W. A. Brend notes that many instances are reported of delivery in women over 50 years of age, some of whom have ceased menstruating several years before conception. He cites from Depasse the case of a woman who ceased to menstruate at 50 and gave birth to a healthy child at 59. More or less well authenticated instances of parturition at 60 or over are, he says, on record. Gilbertson (*B.M.J.*, 1917, 1, 378) recorded the case of a woman whose last child was born when she was 50 years and 7 months old. Kennedy (*Edinb. med. J.*, 1882) recorded a case in which a woman gave birth to her twenty-second child when she was 63 years old, after which she still continued to menstruate. A case in which pregnancy and abortion in a woman of 55 gave rise to serious trouble is recorded in the *B.M.J.*, 1903, 2, 325.

No limit to the child-bearing age is known in English law, but if the question arises it is treated as a matter of fact to be proved by medical and other evidence. Conveyances, however, often include in settlements a condition implying that a woman whose interest in property would pass to her offspring shall be considered infertile on reaching the age of 50. The age, until a short time ago, used to be 54; doubtless experience showed 50 to be quite safe. If such interests, vested in a woman under a settlement, are unduly hindering the potential interests of persons in whom they would vest if she had no children, and the settlement contains no such condition, the court will sometimes make an appropriate order, but only with the consent of all the interested parties.

Paul-Bunnell Test in Infectious Mononucleosis

Q.—What is the Paul-Bunnell test? And what is its rationale? At what stage in infectious mononucleosis should it be applied, and what reliance should be placed upon it? Is there any evidence that infectious mononucleosis is commoner than formerly?

A.—1. The Paul-Bunnell test depends on the presence in the serum of patients with infectious mononucleosis of agglutinins for sheep red blood cells. For the test, 2 to 3 c.m. of the patient's blood is withdrawn, the serum is separated, mixed in falling dilutions with a 2% suspension of sheep blood cells (preferably a week old), incubated at 37° C. for 2 hours, and the result is read after standing overnight at room temperature or in the refrigerator.

2. These agglutinins come into the category of heterophil antibody—that is, they are evoked not by sheep cells but by the causal agent, presumably a virus, of glandular fever. This apparent anomaly is similar to the phenomenon, first described by Forssman, of the production of antibody to sheep cells by injection of guinea-pig organs into a rabbit.

3. The reaction becomes positive about the end of the first week of infection, but may be delayed till the third week or later. As a

rule it becomes negative fairly early in convalescence. As some normal sera give positive reactions in low dilutions, it is essential to establish the diagnostic titre (usually 1/50 to 1/100) with the particular technique used. False-positive reactions may also result from the injection of foreign protein. Now, many cases, because of the exudate on the throat, are diagnosed as diphtheria and given antitoxin. If the Paul-Bunnell test is done 7 to 10 days later a positive reaction may be due to the injection of the horse serum. Fortunately these false-positive agglutinins can be removed by absorption of the serum with an emulsion of guinea-pig kidney, which leaves the true agglutinins unaffected. Most cases of glandular fever with a typical blood picture (leucocytosis of 12,000 to 18,000 white blood cells, with 50 to 70% abnormal mononuclear cells) have a positive Paul-Bunnell reaction, but other clinically similar syndromes with a lymphocytosis fail to give a positive reaction.

4. There has been an increased incidence of glandular fever since the war, presumably because of the opportunities for spread among susceptible young adults brought together in the Services. Many cases are misdiagnosed—those with a rash as rubella or scarlet fever or paratyphoid; the more common anginous type with throat exudate as diphtheria.

INCOME TAX

Purchase of Remainder of Practice

G. M. bought his former partner's half-share in May, 1942, and became sole proprietor of the practice from that date. He is advised to claim "cessation and recommencement." What difference will that make to his liability to tax?

* On whatever basis he is assessed, G. M. is liable to account for tax on the whole income of the practice as from May, 1942. If he does not claim cessation the basis of assessment will remain unaltered—i.e., it will be the amount of the profits of the practice (not of his share only) for the previous year. If he does claim cessation, he will be treated as starting a new practice as from May, 1942, and will pay on the basis of the actual earnings of the period to April 5, 1943, and, for 1943-4 and 1944-5, on the amount of the profits for the year to May, 1943. (He has, however, a right to have the assessments reduced to the actual profits if they should be less.) It will be seen, therefore, that "cessation" will be beneficial if the profits of the practice tend downwards (e.g., because of increased expense for assistance) and the adverse if the profits rise after May, 1942.

Life Assurance—Wife's Interest

D. H. inquires as to the effect of a whole-life policy on death duties—(a) if the benefit of the policy remains in his estate, and (b) if it is made over to his wife.

* It has to be remembered that a life policy grows in value from year to year, and that value belongs to someone—e.g., in this sort of case either to the husband or to the wife. If the individual to whom it belongs dies, the value at that date (the "surrender value" in the case of the wife) forms part of the deceased's estate and is accordingly liable to carry death duty. D. H. should decide whether he wishes his wife to own the benefits of the policy. If he does he can either have the policy drawn up to provide for that or "assign" the policy to her. Either of these methods is preferable to giving her the money with which to pay the premiums, because the last-mentioned procedure lacks the definite legality and clearness which the other methods provide. In short, life assurance is a method of saving money. The money so saved creates an asset, and when the owner of that asset dies it is part of his or her estate. The income-tax allowance would not be affected by assignment to the wife or by payment of the premium by her.

Payment for Wife's Services

R. S. pays his wife £50 per annum for secretarial work in connexion with the practice. The inspector of taxes declines to agree to a deduction of more than £26.

* An inspector of taxes is not entitled to say that some expenses are greater than they need have been, and if the payment of £50 is made bona fide for secretarial work the whole amount is allowable. On the other hand, however, if the £50 is clearly excessive for the value of the services rendered—which is presumably not the case—our correspondent might be well advised to compromise rather than take the point to appeal before the Commissioners.

J. R. pays his wife £80 a year for assistance as secretary, etc. What relief is the result?

* The £80 can be deducted as an expense of the practice, thereby reducing the assessment on the profits by that amount. No tax is due from the wife as the amount is covered by the special allowance for wife's earnings. If the payment had been £100, the profits would have been reduced by £100, and the wife's income would have been liable to tax on £100—1/10 of £100=£90, less £80—i.e., on £10.

LETTERS, NOTES, ETC.

Nail Trephining

Surg. Lieut. J. W. HALL writes: Dr. H. M. L. Murray (Oct. 2, p. 527) describes trephining the nail in cases of subungual haematoma by an ordinary twist drill. Even this instrument has a simple modification which is most successful in subungual haematoma and subcuticular whitlow. A short length of stiff wire filed to a point is heated to red heat and rested perpendicularly upon the nail. A sensation of apprehension at the cloud of smoke is all the patient need suffer if the wire is removed as soon as the nail is pierced. The release of blood or pus is as spectacular as it is gratifying. I claim no originality for this advance in surgery, as I first saw it performed by a Naval colleague who had the opportunity to perfect the instrument by the facilities offered by one of H.M. Dockyards.

Resuscitation by Rocking

Dr. A. R. NELIGAN (2nd Worcs. Home Guard) writes: There is a similar but simpler and cheaper gadget than Major Bowma's Edgar's (July 24, p. 119) which works well. Lengths of 1 in. are cut from 1½-in. angle iron (many could be got from the frame of an old bedstead). Two are screwed under each pole of the Army stretcher about 3/4 in. on either side of the centre, angles toward the handles. It would be easy to fit these stops to a number of stretchers, or at any rate to have them at hand, cut and drilled. This is important when dealing with several cases at the same time—on board ship, for instance, as Dr. Keevil points out (Aug. 7, p. 179). An orderly made them for us, as well as a very good trestle from old 1-in. water-piping; but this is a luxury for teaching purposes. We can use our stretchers anywhere.

Dr. W. ST. AUBYN HUBBARD, of Mylor Bridge, Falmouth, writes to say that after reading Dr. F. C. Eve's last article in the *Journal* he had a stretcher and folding trestle constructed with a few special features. The rocking stretcher is only 7 ft. long, thus avoiding high trestle and making it more convenient for transport. It has a bandaged figure in the Schäfer position outlined on the balloon fabric used instead of canvas. It has small cleats underneath which make it easy to bind the patient quickly and securely without knots or to sling the stretcher from the near-side handles of a car. The whole apparatus can be made for about £3 by any competent carpenter. Instructions should be placed near the quays, stressing the importance of using the Schäfer method until the stretcher arrives and the patient is actually upon it. Dr. Hubbard also suggests the similar small boat-cleats beneath the poles of Army stretchers would prove a godsend to stretcher-bearers and R.A.M.C. personnel in forward areas. Stretcher-bearers under fire have no time to lose and a quick method of securing casualties to the stretcher may save lives, especially when the carry is over rocky country.

Tossing the Needle

Dr. ALASTAIR BAIN (Upminster, Essex) describes the insertion of a hypodermic needle in such a way as to cause a minimum of pain. He writes: The syringe is duly loaded and with needle attached is held as in the correct method for throwing a dart in the game known as darts. The range is about three inches, but the syringe hardly leaves the hand. In other words the hand follows through and the syringe is thrown like a dart at the target area. The patient like it, preferring it to the more orthodox method of pressing in the needle, stretching the skin at the same time. In the method here described it is desirable but not necessary to stretch the skin with the left hand. The idea—which is, no doubt, not new—was suggested to me by the technique of Dr. Katz, who recently acted as locum tenens for me. When I came home a patient told me that Dr. Katz actually tossed the needle at her for a hypodermic injection, then attached the syringe to the needle. I have not tried this mainly because I like to have the needle attached beforehand, but the patient fully approved of the method of Dr. Katz.

Retrieving Foreign Bodies

Dr. W. E. McCULLOCH (Kingston, Jamaica) writes: Dr. Richard Fawcitt's memorandum on the cotton-wool sandwich (March 21, p. 352) prompts me to send you this note. My practice has been to make the cotton-wool more palatable by mixing it with a generous portion of butter. It is more easily swallowed that way, and is great advantage with children. It is astonishing how few houses have cotton-wool available at an emergency. In the case of my own nephew, who had swallowed a carpet tack, a reel of cotton thread cut into two-inch lengths and well mixed with butter was passed in twenty-four hours as a bolt in the centre of which was the tack. The most curious accident in my experience was that of a female patient who had put a pin in her mouth when she prepared for examination. An ungentle thumb on a pathological gall-bladder caused a sharp intake of breath and pin. Cotton-wool, butter, an entire confidence reassured the patient and she brought me the cocoon of the pin two days later.

THE TREATMENT OF SCIATICA

AN ESSAY IN DEBUNKING

BY

Sir ARTHUR HURST, D.M., F.R.C.P.

Consulting Physician to Guy's Hospital

"The best time to be called to a case of sciatica is when the patient is beginning to get well."—HALE-WHITE, 1917.

"Heaven help the unsuspecting individual who wanders into orthopaedic out-patients these days and admits having sciatica."—ANONYMOUS SURGEON, quoted by Campbell Golding, 1939.

What is Sciatica?

By sciatica is meant pain in the distribution of the sciatic nerve. It was formerly thought to be almost invariably caused by inflammation of the perineural sheath and interstitial tissue of the sciatic nerve, except for a small number of cases of referred pain from disease of the hip-joint. Later, inflammation of the nerve roots was regarded as equally common. Many neurologists still believe neuritis and radiculitis to be the most frequent cause. Since Love in 1939 described how protrusion of the nucleus pulposus of the fourth and fifth lumbar intervertebral disk causes sciatica by exerting pressure on the fifth lumbar or first sacral nerve root, all neurosurgeons and some neurologists consider this to be a common condition and true neuritis and radiculitis to be rare. Symonds (1942, 1943), for example, recently stated that his experience with Service patients has convinced him that prolapsed disk is by far the most frequent cause, and he is unaware of any pathological evidence that true sciatic neuritis ever gives rise to sciatica. "The vision of an inflamed and swollen sciatic nerve so confidently stated to be the cause of the syndrome in question has never yet been granted to human eyes." It is somewhat surprising to read in an Army Medical Bulletin published in Oct., 1942, that fibrositis is the commonest cause of sciatica. According to Good (1942) the pain in the vast majority of cases, both in soldiers and in civilians, is referred from disease of the quadratus lumborum, glutei, and tensor fasciae latae muscles; it very rarely arises in the roots or trunks of the sciatic nerve.

The most recent theory concerning the pathogenesis of sciatica is that of an ex-president of the British Orthopaedic Association, who has expressed his conviction that spinal arthritis is by far the commonest cause (Bankart, 1943). Like Good, he does not even mention intervertebral disk prolapse as a possible alternative. He believes that the inflammation spreads from the joints to the spinal nerves in the intervertebral foramina and so causes neuritis. In his experience most cases respond to heat, massage, and exercises with or without manipulation, but persistent or recurrent pain calls for removal of the lateral intervertebral joints, an operation which "rarely, if ever, fails to cure the sciatica."

It is difficult to reconcile these divergent views, but a review of some of the many forms of treatment which have in turn been popular during the last 50 years suggests the likely explanation.

Treatment of Sciatica, 1901 to 1943

"For immediate relief the deep injection of morphine over the nerve is the most effectual treatment. Not infrequently we see suffering which has been almost intolerable thus removed as by magic, within a few minutes" (Fagge and Pye-Smith 1901). After mentioning this treatment, and also the injection of chloroform into the nerve, Osler (1912) adds: "It is remarkable how promptly, in some cases, the injection of distilled water will relieve the pain." Osler also advised a trial of acupuncture: "the needle should be thrust deeply into the most painful spot for a distance of about two inches, and left for from 15 to 20 minutes." This treatment is still sometimes used. Walshe (1941) writes that "acupuncture of the nerve with a series of specially designed needles is a useful and ancient remedy which acts by puncturing the sheath of the nerve and allowing the escape of inflammatory exudation."

A popular treatment in the early 'twenties was injection into the nerve trunk of 50 to 80 c.cm. of normal saline solution. The effect of this, according to Wilfred Harris (1926), was "to cause it to swell up in an egg-shaped form, separating the nerve bundles and bursting asunder laterally any adhesions that have been formed." Soon it became apparent that equally good results were obtained when the nerve root was missed and the saline solution was injected somewhere in its neighbourhood, when there could be no question of breaking down adhesions.

I do not know who first suggested substituting oxygen for saline solution, but this treatment was widely practised for a few years. Kinnier Wilson in his *Neurology* (1940) ascribed the benefit which followed to the provision of "a sort of air cushion for the inflamed nerve"—a quaint variation from the earlier notions about breaking down adhesions.

In 1930 William Evans reported the results of treating 40 cases of "primary, idiopathic, essential sciatica" by the intrasacral injection of about 80 c.cm. of fluid into the epidural space. As normal saline solution was as effective as novocain, and as pain was often experienced in the course of the nerve during the injection, it was presumed that it acted by stretching the nerve roots; and this was found to occur by experiment on the cadaver. Complete relief was obtained in 60% of cases and considerable benefit in 13%. For a time this method was widely used, but as it was more difficult to carry out without being any more effective, it was gradually replaced to a great extent by the older methods of injecting in or near the nerve trunk.

Good (1942), believing that the origin of the pain in sciatica is almost always muscular, states that he obtained permanent relief almost instantaneously by injecting procaine into each "myalgic area" in all but one of 65 cases, the one exception being not unnaturally assumed to be a malingerer. In striking contrast with Good's claims of permanent recovery following injection, Hyndman, Steindler, and Wolkin (1943), who were apparently unaware of his work, published results which seem to prove that his success must have been the effect of

suggestion and of nothing else. "Out of the fog of ignorance which has hung for so long over the subject," they write, it has become clear that all cases are due either to direct pressure by a herniated intervertebral disk or to a reflex neuralgia from a small well-localized painful area in the fibrous tissue of the lower part of the back. Apparently every case of disk pressure was subjected to operation, as there is no mention of any alternative treatment, and the possibility of spontaneous recovery with rest is not mentioned. In the fibrositic cases injection of procaine into the tender focus completely abolished both local and radiating pain. *"The patient was warned that with the wearing off of the procaine effect in from several hours to several days the pain, both local and radiating, would return worse than ever. Having enjoyed a brief spell of complete relief, he keenly resented the return of his complaint."* Treatment by immobilization (traction, plaster, brace, cast, and occasionally operative), hot packs, massage, cathartics, and aspirin then led to gradual recovery.

Soldiers are even more easily suggestible than ordinary people, so that when they are sent to "the man who cures sciatica" they have their minds well prepared for his particular form of suggestion therapy. As Good finds myalgic points in 100% of soldiers with sciatica it is obvious that he must produce them by unconscious suggestion in at least 50%—a minimum estimate of the proportion caused by pressure on the roots or inflammation of the trunk of the sciatic nerve. Having suggested a myalgic point it is immaterial how he suggests it away, and an injection of novocain is as good a method as any other, although no doubt an injection of morphine, saline solution, air, or nothing at all would do equally well so long as there is a prick, as with the older forms of unconscious suggestion therapy by injection into or near the trunk or roots of the sciatic nerve. It is inconceivable that the analgesic effect of novocain could have any direct action, because the anaesthesia it produces is very evanescent, as Hyndman and his colleagues' patients found to their cost, and it could not influence the inflammation or other changes in the tissues which are supposed to produce the myalgic spots. The whole story is reminiscent of Babinski's method of curing hysterical paralysis. He had proved by a long series of investigations that hysterical anaesthesia is always the result of unconscious suggestion by the observer, and had no difficulty in inducing cutaneous anaesthesia in the paralysed limb by gross suggestion. He then cured the hysterical anaesthesia by painful faradism, at the same time suggesting that the associated paralysis would disappear, which it invariably did.

Hugh Wingfield, who had a great reputation for his success as a hypnotist about 25 years ago, invented a treatment of sciatica, a description of which was published in 1917 by Sainsbury, as Wingfield was too modest to do so himself. The treatment consisted in painting the skin over the course of the sciatic nerve with fuming hydrochloric acid; the skin was left uncovered till the fluid had completely evaporated. Although it would burn a hole in linen, it produced little or no irritation of the skin, so did not act by counterirritation. Wingfield obtained uniformly satisfactory results even in the most chronic cases, and Sainsbury also was much impressed with its value. I used it a number of times myself, and there was no doubt it often led to the rapid disappearance of the pain. The cases were so unpleasant that one had to protect one's eyes and nose during the application, and I have little doubt that the psychological effect of having the fuming fluid applied to the painful area was the cause of the success of the treatment.

Rational Treatment of Sciatica

Civilians engaged in hard manual labour and soldiers ought to be particularly easy to cure, because they are unable to carry on with their duties from the first day of an acute attack and so seek medical help at the earliest possible moment, just when treatment by rest gives the best results. Rest in bed from the onset of symptoms leads to rapid improvement, and often to complete recovery in two, three, or four weeks. Complete immobilization by splint or plaster is not often required, as the patient keeps sufficiently quiet and is far more comfortable if allowed to choose his position and vary it slightly from time to time. In exceptionally severe cases, however, fixation by means of a plaster spica, as "advocated

30 years ago by Hurst, is more successful than any other method" (Symonds, 1943). The patient should throughout be encouraged to expect rapid recovery, complete enough to allow a return to full duty within a fortnight of getting up. It will then be unnecessary to employ any of the forms of suggestion hitherto in use—injection into the nerve by the neurologist, the intervertebral space by the expert, or as near the nerve as he can get by the less expert, into the myalgic spots by those who believe in them, manipulation or a plaster case by two rival schools of orthopaedic surgeons, removal of herniated intervertebral disk by the neurosurgeon and of the lateral intervertebral joints by Bankart, or the application of fuming hydrochloric acid by the magician. Complete rest should be maintained until there has been no spontaneous pain for five days. The patient should then be given active movements in bed and should be allowed up a day or two later. At the same time any abnormality in his posture on standing and in his gait on walking should be promptly corrected by explanation, persuasion, and re-education. With such treatment very few patients will be unable to return to full duty within two months from the onset of symptoms. Without the simple psychotherapy involved in promoting the expectation of rapid recovery, followed by rapid rehabilitation, there is a great tendency for the pain and disability with the abnormal gait and posture to be perpetuated and exaggerated as a hysterical symptom. This is especially likely to occur in the Services, where a man may subconsciously see in his illness a way of escape from an uncongenial life to the comparative comfort and safety of home, and among civilian manual workers, who subconsciously see in it a holiday and possible financial benefit.

Hysterical sciatica, with the associated hysterical posture and gait, may last for weeks or months until it is ultimately cured by the gross suggestion unwittingly given by the believers in the various forms of treatment I have already discussed, helped in the soldier by discharge from the Army and in the civilian worker by a successful claim for compensation. It can also be cured by simple psychotherapy in the form of explanation, persuasion, and re-education when its hysterical nature is recognized—often with great rapidity, even in very long-standing cases, as we found in the many cases of the kind in soldiers which we treated at Seale Hayne Hospital during the last war.

It is important to remember that a diminished or lost ankle-jerk and wasting may persist long after the complete disappearance of active disease. Their presence does not therefore indicate that persistent pain is due to organic disease, although it shows that organic disease must have at one time been present.

The few patients who do not get well after a month of complete rest in bed are among those who give a history and show physical signs of root pressure. A further period of complete rest may still lead to recovery, but if there has been little or no improvement they should be referred without further delay to a neurosurgeon, who will cure them by removal of the herniated intervertebral disk. Pennybacker (1942, 1943), who has verified the lesion at operation in over 150 cases in the past three and a half years, believes that the clinical syndrome of prolapsed disk is characteristic enough for a diagnosis to be made without recourse to lipiodol injections, which may set up a troublesome irritant reaction in the theca. All cases are probably traumatic in origin, but the injury may be trivial and no more than a strain. This is followed by low back pain, often diagnosed as lumbago, which may be severe or nothing more than slight discomfort. The incident is often forgotten, and not related by the patient to the subsequent sciatica; and, as Pennybacker points out, even in cases in which the sciatica follows close on the lumbago, the memory of the latter may be swamped in the more severe existing sciatic pain.

Symonds is convinced that, so far as Service patients are concerned, operation, even in the best hands, has proved so unsuccessful in getting men back to duty that a prolonged period of immobility should be advised, and when this fails to render a man fit for duty within a reasonable time he should be invalided. On the other hand, from my limited experience I have no doubt that, in severe cases in which complete rest has failed to cure, the results of operation are very satisfactory, as the patient obtains immediate relief from pain and is soon able to return to full activity. It is, however, just as important after operation as during treatment by rest to encourage the

patient to believe that his recovery will be rapid and complete, as there is a considerable tendency for a minor degree of pain or weakness to persist as a hysterical condition after the organic cause has been removed. This is especially likely to occur in patients who have already been disappointed at the failure to gain relief from prolonged treatment by rest, physiotherapy, and perhaps injections of one kind or another.

EFFECT OF PREGNANCY AND PARTURITION ON PULMONARY TUBERCULOSIS

BY

RAYMOND C. COHEN, M.D.Lond., D.P.H.

Deputy Medical Superintendent, Essex County Council Hospital,
Black Notley

A voluminous literature has not provided any clear decision on the vital question of the effect of pregnancy and parturition on the phthisical woman. From the middle of the nineteenth century there was an increasing tendency to regard pulmonary tuberculosis, even when quiescent or arrested, as an indication for therapeutic abortion, and, though more recently the pendulum has tended to adopt a neutral position, the fear of the effect of pregnancy on the tuberculous still leads to many such operations. Surely it is time our ideas on this subject should have crystallized out? Moreover, in the last 20 to 25 years improved methods of treatment, and the hard-won skill medicine has gained in applying them, call for reconsideration of therapy which was in danger of being decided by custom. I have had the opportunity of studying this problem from personal experience, and this paper records the results of pregnancy and labour in 100 consecutive cases which have been confined in Black Notley.

The Maternity Unit at Black Notley Sanatorium

In July, 1937, the Essex County Council, in building additional wards at their sanatorium at Black Notley, provided a small maternity unit attached to one of the pulmonary wards. This was designed for the supervision and treatment of pregnant tuberculous women. Much of the success of this novel venture has been due to the advice and guidance of the late Dr. W. Burton Wood, consultant physician to the Essex County Council, whose clinical experience, and help in the solution of problems new to sanatorium administration, have been invaluable.

Any woman resident in the county of Essex who suffers or has suffered from pulmonary tuberculosis is eligible for admission. A number of cases of non-pulmonary tuberculosis have also been confined in this unit, but they are not included in this paper. As a general rule, quiescent cases are admitted 6 to 8 weeks before confinement, but a woman suffering from active disease would of course be admitted as soon as possible after the diagnosis of tuberculosis was made, and retained for treatment as indicated after the labour. A follow-up has not yet been made of the babies born, and this paper is concerned only with the effect on the mother; but it may be said here

that none of the offspring revealed any evidence of tuberculous infection; neither has it yet been reported that any child subsequently developed tuberculosis, with the exception of one who was admitted to the sanatorium at the age of 2½ years suffering from tuberculous cervical glands.

Management of Cases

As regards the management of the expectant mothers, quiescent cases are encouraged to live what one may term an active sanatorium life—i.e., to walk up to two miles daily and perform the little daily tasks which form part of the normal life of such cases in a sanatorium. Progressive cases are managed in accordance with the extent and activity of their pulmonary disease, and on the usual sanatorium lines, including, where necessary, active treatment such as collapse therapy. During labour forceps are not applied as a routine in the second stage, as has been advocated, but only when a definite indication exists. As a general rule, however, no woman was allowed to go more than two hours in the second stage without their use being considered, and if there were signs of maternal fatigue without satisfactory advance of the head they would be applied. For anaesthesia, Minnitt's gas-and-oxygen apparatus is used for normal labours, and chloroform or gas-and-oxygen for any manipulation.

It was found that an artificial pneumothorax did not cause any embarrassment to the mother during labour; neither was it ever necessary to give a refill immediately after labour in order to compensate for the alleged fall in intrapleural pressures which has been thought to occur as a result of the descent of the diaphragm.

It must be emphasized that the results here reported are obtained under sanatorium conditions and only the immediate effects of the pregnancy and labour are available, but it is these which have so often been cited as the dangerous results of pregnancy.

The cases have been divided into three groups: (1) *arrested and recovered cases*—those in which there has been no clinical or radiological evidence of active disease for over two years; (2) *quiescent cases*—those in which the disease appeared to be quiescent on their admission to hospital for confinement; (3) *progressive cases*—those in which there was clinical or radiological evidence of active disease on admission to hospital for confinement.

Results

Any sign of retrogression, however slight, revealed by laboratory or x-ray examination has been accepted for the present purpose as being due to the pregnancy and labour, and, including all such cases, the results may be summarized thus:

TABLE I

Class of Case	No. of Cases	No. showing Retrogression
Arrested and recovered ..	46	3
Quiescent ..	22	2
Progressive ..	32	7
Totals ..	100	12

Increased pulmonary disease was observed in 7 out of 25 progressive cases, but only in 5 out of 75 quiescent, arrested, or recovered cases. The latter is probably no higher a proportion of breakdowns than might be expected to occur in 75 women of similar phthisical history and age group. Further, it would be misleading to assume that these figures indicate that the actively tuberculous show a significantly worse effect than the quiescent cases, as there is no reason to assume that the disease in the former would not pursue its steady and relentless course.

The following points were also brought out by study of the case histories:

1. Of the 3 "arrested and recovered" cases which retrogressed 2 subsequently improved; of the 2 "quiescent" cases 1 improved; and of the 7 "progressive" cases 2 improved.
2. The 12 cases which appeared to suffer as a result of pregnancy and labour all had normal labours. On the other hand the 23 cases which had forceps applied or other intra-uterine manipulations did not appear to suffer as a result.

3. Only 2 women had premature labours: in one of these the pulmonary disease was "recovered," and in the other "progressive."

4. The influence of age and previous pregnancies cannot properly be assessed on only 100 cases, but Table II summarizes the facts available, considering the cases which retrogressed:

TABLE II

	Arrested and Recovered Cases		Quiescent Cases		Progressive Cases		All Cases
	Under 30	Over 30	Under 30	Over 30	Under 30	Over 30	
Primiparae	2	1	2	0	1	2	8
Multiparae	0	0	0	0	3	1	4

Two-thirds of the patients showing retrogression were under 30 years of age, and two-thirds were primiparae. This does not support DuBois' famous remark: "If a woman threatened with phthisis marries she may bear the first accouchement well, a second with difficulty, a third never." The primipara has not had repeated pregnancies to threaten her general health; on the other hand, she is usually younger and in an age group which has a less favourable prognosis for her tuberculous condition than that of the average multipara. It seems probable that this is a more important factor than the number of babies she may bear.

Conclusions

The deductions based on this study of 100 cases of pulmonary tuberculosis complicated by pregnancy are probably accurate for cases of similar social circumstances. It is recognized that much larger figures must be produced before anything approaching statistical accuracy can be reached. None the less, enough experience has been gained to establish certain well-defined clinical impressions, and I have come to these conclusions:

1. Pregnancy and labour *per se* rarely exert any harmful effect on the progress of a woman known to have suffered from pulmonary tuberculosis.

2. It follows that therapeutic abortion is not a procedure to be resorted to simply because a woman is known to have suffered from pulmonary tuberculosis.

3. Active pulmonary disease is seldom accelerated by pregnancy and labour, and I have found that in such cases, treated under favourable conditions, pregnancy has been little more than an incident in their tuberculous career.

With these conclusions in mind, it is possible to counsel the tuberculous woman with greater confidence on the advisability of pregnancy or on the desirability of its termination if already established. It is not meant to imply that a woman suffering from active pulmonary tuberculosis should be encouraged to become pregnant; and there are, of course, other factors to be considered. In the above I have been considering the later stages of pregnancy and confinement supervised in a fully equipped sanatorium, and I am well aware that other considerations may have to be taken into account. There is the immediate and grave risk of infection to which the offspring may be exposed; there is the additional work, there are the disturbed nights, and sometimes the financial strain which may be imposed on the mother; and it may be distressing to a woman with advanced phthisis to endure the added discomforts and fears incidental to pregnancy. In some cases of advanced or very active disease the extra strain of pregnancy might be a precipitating factor to determine a devastating breakdown, and in such cases, if seen early enough in pregnancy, therapeutic abortion should be considered. On the whole, however, this investigation, though limited in numbers, indicates that so long as the tuberculous woman is placed under favourable conditions the risk of pregnancy to her progress has been exaggerated, and in the majority of cases it may safely be allowed to proceed to term.

I wish to express my appreciation of encouragement given by the late Dr. W. Burton Wood in the preparation of this paper, and my thanks to Dr. W. A. Bullough, County Medical Officer, and Dr. M. C. Wilkinson, Medical Superintendent, for permission to publish the results; and particularly to Mr. Alan Brews for his generously given advice and help in obstetrical problems.

DIFFERENTIAL DIAGNOSIS OF CHRONIC SCIATIC PAIN

A NOTE, WITH A SHORT ANALYSIS OF 100 RECENT CASES

BY

W. P. U. JACKSON, M.B., B.Ch., M.R.C.P.

Kellgren (1941) remarks that the term "sciatica" signifies a syndrome of deep pain and tenderness down the back of the leg and thigh, of varying distribution, and it is plain that this is a true statement of current usage. This being so, a diagnosis of "sciatica" without qualification is no more illuminating than a diagnosis of "abdominal pain." Three years ago Love (*Proc. roy. Soc. Med.*, 1939) made a similar remark, but nevertheless the term is still used as a complete and final diagnosis. An excellent War Office publication (*Army Medical Department Bulletin*, 1942) begins by calling for "a greater familiarity on the part of medical officers with the common causes of sciatica in the Army and of their corresponding clinical features."

Aetiological Analysis

Kellgren (1941) divides cases of sciatic pain into, first referred pain from fascial structures in the back or round the hip, including also bone and joint disease, which, he states accounts for three-quarters of all. The rest, except for occasional tumour or similar lesion, he believes to be cases of ruptured intervertebral disk. Bankart's topographical analysis presupposes direct involvement of the sciatic nerve, dividing cases into those with lesions of the cord, nerve roots, foramina trunks, lombo-sacral plexus, or peripheral nerve. Douthwaite (1933) divides cases into primary and secondary, and proceeds further to analyse primary ones into peripheral and central on clinical grounds which I find very difficult to follow. Symonds (*Proc. roy. Soc. Med.*, 1939, 1942) believes that the great majority of chronic cases are due to damaged disk whereas analysis by Henderson (*Proc. roy. Soc. Med.*, 1931) of a large series from the Mayo Clinic showed the disc syndrome in 2% of all cases of low back or sciatic pain. Goo (1943) claims that the vast majority (64 out of 65 consecutive cases!) arise as referred pain from "myalgic spots."

The cases here cited were all chronic or recurrent, most of which had been treated in several hospitals previously. The great majority were admitted to the neurological or neurosurgical unit of an E.M.S. hospital during 1942 as unselected cases of "sciatica" mostly from the Services and resistant to ordinary treatment elsewhere. They represent in general the mixed cases of chronic sciatic pain occurring in increasing number, especially in the Services. All cases were examined by at least two doctors while in hospital, and the final diagnosis was approved by Dr. W. Russell Brain or Mr. D. W. Northfield. I have divided this series as follows:

Diagnosis	Number
Doubtful	21
Fibrositis (local)	20
Ruptured intervertebral disk	18
Hysteria	10
Fibrositis and neurosis	8
Congenital bony abnormality	4
Fibrositis (generalized)	3
Sciatic neuritis	2
Malingering	2
Sacro-iliac strain	2
Lumbo-sacral strain	1
Spinal osteo-arthritis	1
Bony infection	1
Neoplasm of cauda equina	1
Polyradiculitis	1
Secondary carcinoma	1
Disseminated sclerosis	1
Spastic paraplegia (? aetiology)	1
	100

Of the doubtful cases, seven were probable but unproved damaged disk, and the rest were mostly seen in the later stages of a pain from which recovery was occurring and which gave insufficient evidence for a positive diagnosis. These included doubtful cases of zoster, radiculitis, sacro-iliac strain and fibrositis of the ligamentous strain type. There was a probable case of spinal arachnoiditis and one of thicker ligamentum flavum, in which no disk damage was discovered at operation. Others were obscure, and often so rendered superadded neurosis. The ruptured disk cases were all proved at operation.

The Importance of Neurosis

This aspect of the sciatica problem has been largely under-stressed. A knowledge of its frequency, mode of development, and clinical features is of paramount importance—in acute cases for prevention, and in chronic cases for recognition and prompt action. In the present series 10 cases were purely hysterical by the time we saw them. Eight cases of mild fibrositis had a gross overlay of neurosis, while the neurotic element was definitely present in a further 6 cases, classified here under the primary disease. Wilson (*Proc. roy. Soc. Med.*, 1942) also remarks upon the frequency with which neurosis occurs in "sciatica."

Symptoms and Signs

The various groups have been further analysed as regards their history and examination (Tables I and II).

stages, increasing the importance of early and thorough examination. One reason for this overlapping is the frequency with which the various aetiological factors are combined.

There may well be a history of injury to the back in cases other than those of damaged disk; nor is this even the usual thing in this condition (in this series, though Love and Walsh (1938) report such a history in 83%). Similarly, intermittence of the pain, though usual in the disk syndrome, is common throughout the series. Bilaterality of symptoms virtually excludes sciatic neuritis, but nothing else. Suddenness of onset seems more common with fibrositis, while the site of the first pain is more often the buttock in fibrositis and the low back in ruptured disks. Pain on coughing is usual in all groups. Sphincter disturbance, if not hysterical, points to a space-occupying lesion.

TABLE I.—Symptoms

Diagnosis	Onset		Injury to Back		Inability to Straighten Up	Site of Primary Pain								Coughing		Onset associated with Febrile Illness	Pain Bilateral	Pain Intermittent	Sphincter Disturbance	Occupation: Driver of Heavy Vehicle	
	Sudden	On Waking	Lifting	Other		Low Lumbar	Sacral	Buttock	Hip	Groin	Calf	Thigh	Ankle	Shoulders	Pain						No Pain
Doubtful	6		1	3	8	2	7				3			18	2	2	3	16 (6? disk)		6	
Fibrositis (focal)	2	1		3	3	2	10	1			2			14	4	2	4

Notes based on the Tables

Overlapping.—The first thing which emerges from a consideration of a number of cases of sciatic pain is the realization of a complete absence of a single clear-cut group. The majority of all the symptoms and signs may occur in any group, and no one is pathognomonic. This overlapping is a cause of difficulty in the accurate diagnosis of the "sciaticas," and means that there must be a number of "doubtful" cases. The more characteristic signs are most likely to be present in the early

To be of real value true weakness or paresis must be at least moderate in degree, since, even allowing for the reluctance to move caused by pain, it seemed clear that uncomplicated fibrositis often produced evident, though never severe, weakness of the affected part, or even distant from this (e.g., eversion of the ankle in gluteal fibrositis). Such patients may show mild, but certain, wasting of the muscles involved, perhaps due to disuse in these cases of long standing. Paraesthesia and sensory loss occur only in direct involvement of the sciatic nerve or as hysterical phenomena. Postural loss in the toes was here

found in one patient only, who had a ruptured disk severe enough to produce almost complete spinal block.

Postural deformities of the back are non-specific, and Lasègue's test (straight leg raising) is valueless on its own in diagnosis, though useful in assessment of severity and progress. The result of the test should be compared with the patient's ability to touch his toes, and, in organic cases, these two will correspond. The foot plantar-flexion and dorsiflexion modifications of this test seem to be of no diagnostic value. A raised protein in the cerebrospinal fluid signifies an organic lesion, and is common in, but by no means confined to, cases of ruptured-disk. Symonds remarks that in any "long-standing sciatica" the protein may be raised to between 40 and 100 mg. per 100 c.cm.

Tendon Reflexes.—Diminution or absence of ankle-jerk is significant as indicating an organic lesion of the sciatic nerve. Bilateral absence or equal diminution may, however, be congenital or be due to coincident disease. Further, an absent ankle-jerk on one side is not necessarily evidence of present disease, since it may remain permanently depressed after an attack of sciatic neuritis from which recovery has otherwise been complete. In one case of doubtful aetiology, in fact, the reflex was absent on the side opposite from the pain, being brisk on the same side. Bilateral depression of the reflex usually indicates a space-occupying lesion (six cases in this series).

The Value of Straight Radiographs.—In this series abnormalities were revealed by radiographs of the lumbo-sacral region in 16 cases, but in only six were these considered of primary significance. There were included two cases of spondylolisthesis, three of unilateral sacralization of the fifth lumbar vertebra, one of bilateral sacralization with absent twelfth ribs, one spina bifida occulta, two of osteo-arthritis, and a further probable osteo-arthritis with an enormous osteophyte protruding from the body of the fifth lumbar vertebra. This osteophyte, however, and one of the sacralized vertebrae also were on the side opposite to the affected limb. Considerations of this sort must make one chary of accepting x-ray evidence as a diagnostic criterion *ex cathedra*.

A Type of Fibrositis.*—Some of the cases of fibrositis appeared to be associated at their onset with a febrile illness resembling influenza, in which aches and pains were felt first in the back (as is, of course, common in influenzal chills) or in the back and round the shoulders, and then, instead of going away in a few days, remained present, becoming chronic and recurrent. If significance is to be attached to these eight cases, then it would seem either that influenza or influenza-like illnesses should be added to the list of causal factors in fibrositis, or else that fibrositis itself may at its inception be a febrile illness.

Conclusion

Some people still consider "sciatica" synonymous with "sciatic neuritis," and then, calling all cases with pain in the back of the leg "sciatica," make these, *ipso facto*, cases of sciatic neuritis. It is generally agreed that "true sciatica" or sciatic neuritis is uncommon in young people. If there are signs of involvement of the sciatic nerve itself then a ruptured disk is more likely.

Ruptured intervertebral disk, fibrositis, and neurosis are the three states of greatest importance in the causation of chronic sciatica in young people; they correspond with the three types of sciatic pain—namely, neural, referred, and functional—into one of which latter groups all cases of sciatic pain should be placed as a preliminary step in accurate diagnosis.

I should like to thank Dr. Russell Brain and Mr. Northfield for their advice and permission to make use of the material supplied by their patients, and also Mr. R. L. Galloway, medical superintendent of Chase Farm Hospital, for his permission.

THYMECTOMY FOR MYASTHENIA GRAVIS

BY

MAURICE NELLEN, M.R.C.P.

Medical Registrar, St. Mary's Hospital

The association of an enlarged, persistent, or cystic thymus gland with myasthenia gravis has long been known. The removal of a thymic cyst in a patient with myasthenia gravis was reported by Blalock *et al.* in 1939. The patient had been operated on four years before, and had apparently remained cured for that period. Since that report the operation of thymectomy for this disease has been performed, sometimes successfully, by different surgeons.

Blalock, Harvey, Ford, and Lilienthal (1941) recorded six cases of thymectomy for myasthenia gravis, with one post-operative death. Of the remaining five cases, three after a varying period were cured and needed no more prostigmin; two were improved but still needed prostigmin. More recently, in England, James Carson (1943), in a report on nine cases of thymectomy for myasthenia gravis, stated that three of these patients had died after operation; three had recovered and needed no prostigmin, and remained well for three, six and nine months after operation. Three showed no improvement. Russell Brain (1943) reported three cases of myasthenia gravis in which he had recommended thymectomy, but none of these cases had improved as a result of the operation.

Case Report

A nurse in a London hospital, aged 23, first attended Dr. Wilfred Harris's out-patient clinic at St. Mary's Hospital on May 19, 1942. She gave a history of having been quite well until the beginning of March, when, after a bad cold, she began to have difficulty in swallowing, nasal regurgitation of food, and diplopia. These symptoms were becoming progressively worse, and for the preceding two weeks she had noticed weakness in the arms as well. The symptoms were always worse at the end of the day.

Examination disclosed weakness of the soft palate and weakness of eye and lip movements. The patient had obvious ptosis and diplopia, and also a myasthenic facies. She was at once admitted to the wards, and responded dramatically to 2 mg. of prostigmin subcutaneously, being able to eat normally for the first time for two months. She could now close her mouth, whereas this was impossible before the injection. Her prostigmin requirements increased throughout the period of her first stay in hospital from two injections of 2 mg. a day to one injection of 2 mg. in the morning and 30 mg. by mouth four times a day. She was discharged on June 13 on this dosage.

She was readmitted on June 27 needing about the same amount of prostigmin, but her requirements rose from this time until, about two months later, she was receiving 225 mg. daily to control her

GRAPH 1.—Showing increase of strength of hand contraction after 1 mg. of prostigmin into brachial artery.

weakness. On July 2 1 mg. of prostigmin was injected into the patient's right brachial artery. This rapidly increased the strength of the right hand, which was maintained for over three hours. Graph 1 illustrates this increase of strength. F. R. Fraser *et al.* (1937-8) by injecting prostigmin into the femoral artery showed the resulting increase in strength in the limb. Harvey and Lilienthal (1941) found that if 0.5 to 1 mg. of prostigmin is injected into the

brachial artery of a myasthenic patient strength of the hand is maintained or increased, whereas the hand of a non-myasthenic becomes weak and the muscles fasciculate.

On July 6 Mr. Dickson Wright removed a portion of the thymus gland through the suprasternal notch, using a suprasternal incision in the neck. She appeared to improve very slightly after this operation, but soon relapsed. On July 29 Dr. Courtenay Gage gave deep x-ray therapy to the thymus gland. The patient did not seem to improve after this therapy, and was discharged on Aug. 24, being treated with prostigmin as an outpatient.

On Sept. 16 she was urgently readmitted, being almost bedridden. At this time she was needing an injection of 2.5 mg. of prostigmin at 6 a.m. and 225 mg. during the rest of the day. On Sept. 21 Mr. Dickson Wright removed the rest of the thymus gland by splitting the sternum. The gland was as usual bilobed, and on the right side went quite deep between the mediastinum and pleura. She made an excellent recovery from the operation, but for the next six weeks required as much prostigmin as before the operation. From the middle of November onwards she began to need less and less, and in Feb., 1943, received only 30 mg. a day, and in March about 15 mg. (Graph II). Since June 7 she has not required any prostigmin at all, and she feels as fit and as strong as she "has ever felt in her life."

Pre- and Post-operative Treatment for Thymectomy

The onset of an upper respiratory infection often accompanies the onset of myasthenia gravis or causes an exacerbation of the condition. It is therefore very important to prevent any infection in the pre- and post-operative periods. Blalock and others (1941) recommend the following regime. They advise against operation if there has been a history of infection for the preceding ten weeks. The patient's blood should be cross-matched with a donor. Enough sulphadiazine should be given to maintain a blood level of 5 or 6 mg. per 100 c.cm. Thirty minutes before induction of anaesthesia 1.5 to 2.5 mg. of prostigmin, 0.6 mg. of atropine sulphate, and 0.6 gr. of morphine are given subcutaneously. At the end of the operation, usually one to one and a half hours after induction, 1 to 1.5 mg. of prostigmin and 0.6 mg. of atropine are given. The post-operative dose of prostigmin is based on the dose required pre-operatively—usually 1 to 1.5 mg. every two hours for the first day; after this 30 to 45 mg. by mouth two- to three-hourly. Often there is an increased need for the first two days following operation, and only after a few weeks does the requirement lessen. In the present case the prostigmin requirement was less only after about six weeks, which is longer than in previously reported cases, and more time was needed for completion of treatment.

It is well known that myasthenia gravis is characterized by remissions. Dr. Wilfred Harris in a personal communication has informed me of a case of his that appeared to be well for 20 years, and then relapsed. It may be that thymectomy effects a remission and not a permanent cure. There, however, seems enough evidence now to warrant a thymectomy in every case of myasthenia gravis.

Although Mr. Dickson Wright in this case operated in two stages, he informs me that he has since employed a one-stage sternal splitting method. It is generally agreed that the latter is the method of choice.

Rationale of the Operation

Norris (1936) stated that 50% of the reported cases of myasthenia gravis coming to necropsy have shown some form

of thymic involvement. Half of these reveal what have been regarded as benign tumours of the thymus. Norris interprets these as conditions of extreme epithelial hyperplasia. The other half he interprets as conditions of moderate epithelial hyperplasia. In our case Prof. W. D. Newcomb reported on the thymus as follows:

"Thymus with hyperplastic lymphoid tissue. Small Hassall's corpuscles, very little fat. In view of her age of 23 the organ is certainly hyperplastic." Harvey and Lilienthal (1941) state that it seems reasonable to assume that some inhibitor substance released into the circulation in varying amounts might be responsible for the functional defect in myasthenia gravis. They further state that there is much evidence which points to the thymus as a possible source of this hypothetical substance.

Adler (1938) claimed to reproduce the disease in dogs with grafts and saline extracts of calf thymus, but his work has not been confirmed.

Summary

A successful case of thymectomy for myasthenia gravis is reported. Other successful cases recorded in the literature are mentioned. Pre- and post-operative treatment is discussed. A brief summary of the rationale is given.

THE EFFECT OF CHEMOTHERAPY ON THE MORTALITY FROM PNEUMONIA IN GLASGOW

BY

THOMAS ANDERSON, M.B., Ch.B., F.R.C.P.Ed.

Physician-Superintendent, Knightswood Fever Hospital, Glasgow

In certain infectious diseases it has not been difficult to show that the introduction of sulphonamides has had a good effect upon the general mortality. Martin (1942) in a straightforward comparison was able to demonstrate that in cerebrospinal fever and puerperal sepsis a definite change had occurred coincidentally with the introduction of these drugs. In his examination of pneumonia, however, he noted that "although there has been an undoubted decrease in the mortality rate . . . an estimate of its extent is rather speculative," and suggested that in the period 1939-41 the expected deaths might have been 10% higher than those actually recorded. This can scarcely be regarded as a tremendous achievement, especially since the clinician has recorded reductions in case fatality rates to about a third of their former level. Further, chemotherapy has the particular merit of simplicity of administration, so that in a general way it should be as effective at home as in hospital. It has been shown (Anderson, 1943) that the efficiency of sulphyridine is impaired in those over the age of 40 years. Since pneumonia is more severe in the older age groups it seems possible that the apparently slight reduction in general

GRAPH II.—Showing decreased need for prostigmin after thymectomy for myasthenia gravis.

mortality might be caused by a continuing high mortality in those past middle life. The purpose of this analysis is to study such a possibility.

Since 1922 the Medical Officer of Health for Glasgow has encouraged the notification of cases of pneumonia, and has annually made available a considerable amount of accommodation for their treatment in hospital. Smith (1928) estimated that about 75% of the cases occurring in the city are notified. As he pointed out, the fact that the notified cases represent only three-quarters of the total incidence makes the figures of little value in estimating mortality rates. Despite the validity of this criticism, the notification figures presumably reflect the prevalence of the disease, and they therefore have a value in assessing the fluctuations in annual incidence. A further inference, however, may be drawn—namely, that from year to year the practitioner will notify similar types of case, and, of immediate importance, that the age-grouping of the notifications will reflect the age-grouping of the disease in the community. Although he may tend to notify more cases from those age groups in which the disease is more severe, it seems reasonable to suggest that such a tendency will remain fairly constant from year to year.

Now, a crucial difficulty in assessing pneumonia mortality is the lack of figures expressing the incidence of the disease. If the present argument is sustained, however, it should be permissible to compute the ratio of deaths to notifications for different age groups in two periods of time, and, by comparing them, to assess any changes which had occurred between the mortality of these age groups. The accompanying table shows

Table showing Notifications and Deaths from Pneumonia in Glasgow, 1922-41

Age Group (Years)	1922-38			1939-41			Ratio B x 100 A
	Notifica- tions	Deaths	Deaths per 100 Notifica- tions (A)	Notifica- tions	Deaths	Deaths per 100 Notifica- tions (B)	
0-1	18,234	8,920	49.02	3,088	1,135	36.76	75.0
1-10	46,693	6,795	14.45	5,630	375	6.67	46.2
11-20	8,777	586	6.67	1,314	31	2.36	35.3
21-30	13,759	3,760	27.33	2,280	264	11.58	42.3
31-40	12,640	9,038	71.53	2,910	1,318	45.29	63.3
All ages	100,103	29,099	29.09	15,222	3,123	20.51	70.5

the relevant figures for the pre-sulphonamide period 1922-38 and for 1939-41. In column 8 the ratios of deaths per 100 notifications in 1939-41 have been expressed as a percentage of those encountered in 1922-38. It is clear that the change which has occurred in the last three years is more marked in certain age groups than in others, the fall under 1 year and over 45 years being less striking than it is between these ages. It is justifiable to conclude that the cause of the reduction in mortality noted in 1939-41—presumably chemotherapy—has been less effective in those extreme age groups. The table indicates too, as one would expect, that the ratios for the total figures in the two time intervals show a fall of less than a third in the 1939-41 period: in other words, the poor results at the extremes of life do mask the benefits sustained in the middle age groups.

Discussion

In the first place there is no doubt that the consolidation is more usually bronchial in distribution at the extremes of life, whereas a lobar pneumonia is the more characteristic lesion in middle life. As Cruickshank (1943) has recently pointed out, bronchopneumonia affects primarily the mucous membrane of the bronchial tree. Actual invasion of the lung parenchyma is less in evidence; while a more generalized invasion (as judged, for example, by the occurrence of bacteraemia) is much less common than in lobar pneumonia. This places the organism in a situation almost, as it were, outside of the body and so less liable to the action of sulphonamides. In lobar pneumonia, on the other hand, the very invasion of the lung parenchyma places the organism not only in a position more accessible to the drug but also (again in contrast to bronchopneumonia) to the action of the phagocytes.

Such an explanation invites the further question as to what influences the form of the consolidation. The modern concept

regards bronchopneumonia as an autogenous infection, and before autogenous infection can occur the individual resistance has presumably been considerably reduced. Despite this lowered resistance of the host the organisms are of such low virulence or invasiveness that tissue invasion is not a prominent feature. The pneumococci isolated from cases of lobar pneumonia, on the other hand, usually belong to the more invasive Types I, II, V, and VII—types which are rarely isolated from normal throats. Here, one may assume, the individual resistance is not so low as to permit infection by the commensal strains of low virulence. Such a conception suggests that lobar consolidation is the mode of reaction of the individual whose basic resistance to pneumococcal infection is high; whereas bronchopneumonia is the reaction of the individual whose basic resistance is poor.

The importance of this element of non-specific or native resistance in the pathogenesis of pneumonia is further emphasized by the well-established relationship between high incidence and bad social and environmental factors. That these factors possibly operate more harshly at the extremes of life might be suggested from the curve of case mortality with its peaks at the extremes of life. Britten (1942) has recently reported a valuable analysis of the incidence of pneumonia as recorded in the National Health Survey carried out in America during 1935-6. Although the analysis in respect of economic status shows a correlation with each age group (except those over 75 years) the effect is most marked in infants and young children. Similarly in respect of overcrowding (although here the cases are only divided into three broad age groups) the effect is most pronounced in the two outside age groups and least between 15 and 24 years. Smith (1928), too, showed that the mortality under 5 years of age was closely related to environmental conditions.

That these are necessarily the only factors operating to produce the apparently poorer results at the extremes of life is unlikely, but their restatement is perhaps timely. The present tendency is to emphasize two main aspects of chemotherapy—namely, the susceptibility or resistance of the pathogen to the drug, and the rapid attainment of what is usually termed an optimum level of drug in the blood stream. It is not sufficiently stressed that the most successful achievement of bacteriostasis still requires the host not only to cope with the destruction of the bacterium but to restore the inflamed tissues to normal. The capacity of the host to react aggressively to his infection is clearly an essential element in his recovery; and consideration of the results of chemotherapy in pneumonia would suggest that in the absence of this resistance the infection may not be stemmed in individuals who are unable to fulfil their part of the bargain.

To define what is meant by non-specific resistance is not easy. The study of natural resistance has been neglected mainly because our present picture of acute infections lays so much emphasis upon the bacterial cause and the specific immune reactions to which it gives rise in the host. The failure of specific antisera and vaccines to enhance the effect of the sulphonamides in pneumonia—and perhaps in cerebrospinal fever (Beeson and Westerman, 1943)—suggests that those who now die do not die because of any lack of specific antibody. It may be advanced that knowledge of what will increase non-specific or tissue resistance is required if the results of chemotherapy are to be improved.

Summary

The success of chemotherapy in hospital clinical trials has the danger of inducing complacency regarding the problem of pneumonia control. When it is realized that the fall in general mortality is comparatively slight, there is clearly little room for satisfaction. Figures are presented which suggest that sulphonamides are less effective in the treatment of pneumonia at the extremes of life; and the possibility that this relative failure is due to a lack of non-specific resistance is discussed.

Medical Memoranda

Immediate Blood Transfusion in Obstetric Shock

The following record shows the value of immediate blood transfusion in a case of obstetric shock with normal labour and without excessive haemorrhage.

CASE HISTORY

Mrs. B., a primipara aged 28, started labour pains in the early hours of July 28, 1943. Uneventful first and second stages of labour resulted in the normal birth of a female child at 9 p.m. under short terminal chloroform anaesthesia. The fundus uteri, easily palpable at about the level of the umbilicus, soon began to contract, and expulsion of the placenta by Credé's method was attempted without success. The patient's condition was quite good; she had come out of the anaesthetic, her pulse was regular—about 90 beats a minute—and her total blood loss was less than one pint. At about 9.30 p.m., however, she turned very pale and her pulse accelerated to about 120. Abdominal palpation revealed a hard rounded fundus uteri below the umbilicus; there was no visible haemorrhage per vaginam. The placenta was still *in utero*. There was no doubt this was a case of obstetric shock, so the usual anti-shock measures were adopted: the foot of the bed was raised, hot-water bottles were applied, both legs were bandaged, and 1.5 c.cm. of nikethamide (coramine) was injected. No improvement was registered in the patient's condition, and very soon her skin became cold and moist, her lips and gums blue, the pupils dilated, the pulse more rapid (about 180 a minute) and of low tension. Glucose-saline was then given rectally, and St. Bartholomew's Hospital was telephoned with a request for its "flying squad" for immediate blood transfusion. On returning from the telephone the patient was found to be unconscious; her pulse was only just perceptible, and Matron reported that breathing had actually stopped for a short time. Fortunately, the rectal glucose-saline was being retained, and, to my relief, in less than an hour the "flying squad" arrived. It comprised a surgical specialist, an anaesthetist, and a house-surgeon. Very quickly, quietly, and efficiently they set to work and transfused two pints of universal whole blood. The result was incredible. When only one pint had been introduced the patient regained consciousness and the pulse volume increased appreciably, while at the end of the transfusion the pulse was about 100 and had quite good volume. Later, under anaesthesia the placenta was easily expressed with practically no blood loss. With the exception of a rise in temperature on the second day, and a slightly accelerated pulse which persisted for a few days, the patient made an uneventful recovery.

COMMENT

In a case of prolonged labour, or in a difficult forceps delivery, one would not be surprised to find some degree of obstetric shock comparable to that normally observed in surgical trauma. In a normal labour, however, without excessive haemorrhage, post-partum collapse as described above must be rare indeed. In fact, this is the first case I have seen in the course of over 20 years' practice. It would be interesting to know the cause of such a sudden collapse. It has been claimed (Matthews, 1939) that the parturient is especially predisposed to shock, owing to a hypersensitiveness of the nervous system, which is said to be markedly developed during pregnancy. Can it be explained as a result of an intra-abdominal vascular change due to the sudden emptying of the uterus, or as a result of venous stasis, produced in the abdominal cavity by some action of the splanchnic vasomotor system, comparable to the shock occasionally seen after the administration of a large dose of pituitary extract? Has it anything to do with the retention of the placenta?

With regard to the treatment of the condition, the value of an immediate blood transfusion has to be seen to be believed. Yet from an analysis of 765 blood transfusions for obstetric conditions causing haemorrhage and shock conducted at the Glasgow Royal Maternity Hospital, Sheehan (1942) concluded that, whereas the mortality from haemorrhage had been much reduced by transfusions, the mortality from shock was unaffected by them, the general conclusion being that "the value of blood transfusions in shock is doubtful." The discrepancy in the results is, I submit, due to the delay in performing the blood transfusion. This must be given early, as otherwise a condition of "irreversible shock" is reached. As Levinson (1942) says, "early shock in most instances responds very favourably [to blood transfusion], but if the condition has existed for any appreciable time little or no effect is observed."

As the time factor is of such vital importance I would stress the value of blood transfusion "flying squads" and of providing plasma and plasma-transfusing apparatus in nursing homes and the maternity wards of hospitals.

Reviews

ENVIRONMENT AND INFANT MORTALITY

Birth, Poverty, and Wealth. A Study of Infant Mortality. By Richard M. Titmuss. (Pp. 118. 7s. 6d.) London: Hamish Hamilton Medical Books, 1943.

The object of Mr. Titmuss's study is to show (1) that, in spite of the general fall of infant mortality during the last 30 years, the relative advantage of the economically most prosperous class over the least prosperous class has been maintained or even increased; (2) that environmental rather than congenital or hereditary factors are responsible for social-economic diversity.

In analysing the data of 1911 the General Register Office first attempted a social-economic classification, five classes being formed. In successive censuses the classification has been improved, with the inevitable result that comparability has been disturbed. Taking the figures as they stand the rate of infant mortality classified by social-economic class of father in 1911 was twice as high in the lowest as in the highest class. In 1930-2 it was 2.35 times as large; over the period the rate of mortality had fallen from 153 per 1,000 to 125 per 1,000 in the worst social-economic class, from 76 to 53 in the highest class. Mr. Titmuss, aware of difficulty of comparison, made a selection of clearly defined occupations, and his figures make the ratios 2.9 and 2.62 respectively—namely, some but not very much improvement. The official figures show a slight improvement between 1921-3 and 1930-2. A comparison is also made of special occupations. It is possible that Mr. Titmuss is over-anxious to prove a deterioration; a lack of improvement is ample basis for his general argument.

The author then examines the death rates in different sections of the first year of life, reaching conclusions in agreement with those of official commentators—namely, that the social-economic difference is least in the first month of post-natal life, but that even here much of the mortality is preventable. Mr. Titmuss argues strongly against the opinion that heredity is almost everything and environment goes for very little in the determination of infant mortality rates, and also condemns the light-hearted view that a high rate of infant mortality is for the good of the race because it eliminates the "unfit." For the most part Mr. Titmuss is forcing an open door here, and may, perhaps, have gone a little too far in his depreciation of hereditary factors. It is surely true that, under equally favourable environments, selective breeding effects a good deal in producing valuable physical qualities in farm stock or race-horses. However, over-enthusiasm can be forgiven; the author has focused much valuable information.

A STUDENT'S TEXTBOOK OF SURGERY

The Essentials of Modern Surgery. Edited by R. M. Handfield-Jones, M.S., F.R.C.S., and A. E. Porritt, M.Ch., F.R.C.S. Second edition. (Pp. 1,204; illustrated. 40s., plus 11d. postage.) Edinburgh: E. and S. Livingstone, 1943.

The first edition of this book, noticed in our columns at the end of 1938, required reprinting. The demand has continued and a second edition became necessary. The preparation of this has fallen on the senior editor, as his co-editor is away on active service. An expansion and an extensive revision of the articles on wounds, burns, haemorrhage, and shock have been made so that these subjects now occupy two chapters, and represent the results of those modifications of our views and methods of treatment which have come about as the result of this war. There are many new illustrations, including some coloured reproductions of oil paintings made by Miss Zinkeisen. Some figures are borrowed from *Surgery of Modern Warfare*, others from Mr. Watson-Jones's book on fractures. The reproduction of all these is good and so is the printing of the text, so that this edition adds further to the reputation for high quality which the publishing house responsible has been rapidly acquiring in recent times. We find little in the text with which to quarrel, but some confusion seems to exist in the mind of the author of the section on the brain and its coverings in distinguishing between cerebral hernia and cerebral fungus (p. 870). We cannot agree with him that the term "cerebral hernia" should not be applied to those protrusions of brain matter through a deliberately planned decompression

opening, but, on the contrary, regard such as fulfilling all the criteria of a hernia.

On the work as a whole we congratulate both the editor and those contributors whose revision has done much to improve the original text. This second edition should add to the popularity of a now well-established textbook which can be safely recommended to the medical student, of whom it might be said the editor has not only had much experience as a teacher, but (what is perhaps equally important) as an examiner also.

CUNNINGHAM'S TEXTBOOK OF ANATOMY

Cunningham's Textbook of Anatomy. Edited by J. C. Brash, M.D., F.R.C.S. Ed., and E. B. Jamieson, M.D. Eighth edition. Oxford Medical Publications. (Pp. 1,558; illustrated. 60s.) London: Oxford University Press, 1943.

The eighth edition of this work is signalized by a considerable change in the authors who have had a share in its production; this is due partly to the regrettable loss by death of some of its most distinguished contributors—namely, Sir G. Elliot Smith, Prof. T. Wingate Todd, and Prof. David Waterston—and partly to the transference of Sir John Stopford from the chair of anatomy at Manchester to the Chancellorship of that University. These authors have been succeeded by Prof. W. E. Le Gros Clark (central nervous system); Prof. J. C. B. Grant, University of Toronto (respiratory system); Prof. M. R. Drennan, University of Capetown (digestive system); and Prof. A. Durward, University of Leeds (peripheral nervous system). The description of the urogenital system, originally written by the late Prof. A. F. Dixon, has been undertaken by Prof. C. P. Martin, McGill University, Montreal, and a special section on radiographic anatomy by Prof. R. McWhirter of Edinburgh University has been added to the section on surface and surgical anatomy by Sir John Fraser. The work has been edited by Prof. J. C. Brash, with the assistance of Dr. E. B. Jamieson. It is at once evident that the contributors to the present edition are representative not only of British universities but also those of Canada and South Africa.

Perhaps the most striking change in this edition is the inclusion of a large number of photographic and radiographic illustrations and a valuable addendum on radiographic anatomy, comprising a brief account of special methods of examination—e.g., by "contrast media"; this supplies a much-needed standard for interpretation of many appearances seen in radiographic films of normal, healthy individuals of varying ages and sex. Among so many excellent radiographic films it is difficult to choose examples of surpassing merit, but perhaps the reproduction in Plate LXXX of a series illustrating the expulsion of bile by the gall-bladder, as revealed by the administration of "S.T.I.P.P." followed by a fatty meal, and those shown on Plate LXXV, illustrating the course of the foetal circulation and the closure of the ductus arteriosus and ductus venosus in the sheep, by Dr. A. E. Barclay and his colleagues at the Nuffield Institute, Oxford, may be specially noted. Some additional matter bearing on recent research work has been incorporated in all sections of the book, and in face of so much commendable good work there is little to suggest in the way of constructive criticism beyond expressing the view that descriptions of microscopic structure, in order that they may be clearly understood by readers already acquainted with the subject, be accompanied by illustrations of actual microscopical preparations, and that the time has now come when many purely diagrammatic figures may be replaced by accurate drawings or photographs of particular tissues, or of some stages in embryonic development.

Notes on Books

Dr. EDWIN O. GECKELER, believing that every doctor who undertakes emergency work should be able both to insert a Steinmann pin or a Kirschner wire and to carry out proper wound excision without delay, wrote *Fractures and Dislocations for Practitioners* with the object of helping the less experienced in the practice of such procedures. The third edition introduces much recent work relating to fractures which has been learned from war experiences. Attention is appropriately given to chemotherapy, developments in which have practically revolutionized the treatment of wounds. "Bumper" or "pedestrian" fracture receives due consideration and

is well illustrated, but "clay shoveller's" fracture is not mentioned in connexion with the industrial group which includes "dash-board" fractures of the patella and "dash-board" dislocation of the hip. This edition brings a valuable and conveniently sized book up to date and thus adds to the value of an already established work. Illustrations are excellent—it is interesting to notice that one or two are redrawn from Sir Astley Cooper—and the production does not appear to have suffered in any way through wartime publishing restrictions. This is an excellent handbook which can be thoroughly recommended. It is published in England by Baillière, Tindall and Cox at 25s.

The Expectant and Nursing Mother's Cookery Book, written by CECILIA HOOGENDOORN, has a foreword by Mr. W. C. W. Nixon. This book should be possessed by all those who are interested in the health of the expectant and nursing mother. The recipes have been adapted for wartime restrictions. There is much useful advice on the preparation and cooking of food. The publishers are Edward Arnold and the price is 3s. 6d.

The Board of Management of the Australian War Memorial has published from Canberra a booklet entitled *Diseases in the A.I.F. 1916-18*, giving a comprehensive statement of all the non-battle casualties (so far as the records permit) which were sustained by members of the first A.I.F. on the Western Front, or which were the cause of rejection in recruits or were responsible for invaliding to Australia. This is published as a separate appendix to Vol. III of the *Official History of the Australian Army Medical Services*.

Preparations and Appliances

A TABLE-KNIFE HOLDER FOR USE BY THE PARTIALLY PARALYSED

Dr. J. CARLTON HEAL, Exeter, writes:

The table-knife holder illustrated below was designed originally for my personal use when recovering from a traumatic lesion of the left motor cortex. It is, however, of use in partial recovery from hemiplegia and nerve lesions and in advanced rheumatoid arthritis.

After damage to the motor cortex or after pyramidal lesions when the hand has partially recovered, the simple grasp may be quite strong but the higher "movement patterns," which are developed latest, are lost (cf. Wartenberg's sign). To hold an

ordinary table knife correctly may be regarded as the "acid test" of recovery of hand and finger movements. In order to use one, the three inner fingers must be fully flexed, the index partially extended and abducted, and the thumb oppose with the proximal joint flexed and distal joint extended. Moreover, all these movements must be done very firmly.

This little gadget (the illustration of which is self-explanatory) embodies a ring through which the index finger is slipped as a trough to steady it. It is made by Messrs. Down Bros., Ltd. London, is handy and light, and is ingeniously designed to click quickly on and off any small table knife.

NOMOGRAPH FOR BLOOD UREA CLEARANCE

Dr. M. C. Davis and Miss Mildred Barnard have devised a nomograph (published by W. Ramsay (Surgical) Publicity Ltd., Melbourne, 6d.) for determinations of blood urea clearance. There can be few laboratories in this country which perform so many clearances that this nomograph will be a real saving of time, but those who use it will have the satisfaction of knowing that the proceeds from the sale of these charts are devoted to the Alfred Hospital Clinical Fund for Students.

SATURDAY DECEMBER 18 1943

STAPHYLOCOCCAL PNEUMONIA COMPLICATING INFLUENZA

Staphylococcal pneumonia following influenza, though not very common, is no new thing. In the influenza pandemic of 1889, and even earlier, necrosis of the bronchi and of the alveolar walls had been observed in cases of influenzal pneumonia, and staphylococci had occasionally been cultivated from the lesions. Netter¹ found mixed infections (staphylococci and streptococci in one, staphylococci and pneumococci in the other) in two out of eight such cases complicating *la grippe* in 1889-90. Only exceptionally were staphylococci invaders of the lungs in cases of influenza in 1918; but the exceptions are striking. Thus, at Camp Jackson, Chickering and Park² recorded that half of 312 fatal cases cultured yielded staphylococci as the only or predominant organism. Patients dying early showed intense congestion, rupture of alveolar walls, and exudation of red cells and serum into the alveoli; those surviving longer showed innumerable abscesses in the lung. In cases at the No. 3 Canadian General Hospital,³ where staphylococci as secondary invaders were second only to Pfeiffer's bacillus, staphylococci were cultivated in 14 out of 67 cases of influenzal pneumonia, and were grown from the heart blood in 8 cases. In Malta⁴ the organism was present in large numbers in the sputum of 16 out of 18 cases, and was recovered from the lungs of 9 out of 11 patients who died. Three cases had empyema, and staphylococci were recovered from each of them. Throughout all these observations the predominant staphylococci were *Staph. aureus*. Winternitz, Wason, and McNamara⁵ observed that staphylococci were more likely to be recovered from influenzal pneumonias if necrosis, abscess formation, or organization were occurring, though this tendency to purulent resolution and organization was characteristic of the epidemic, even in those cases from which no staphylococci could be grown.

The pathological picture is remarkably uniform. There is a necrotizing process in the tissues with acute exudation, haemorrhage, and oedema. The "hyaline membrane" in the bronchioles (described by many authors) appears not to be pathognomonic of either influenzal or staphylococcal infection, but a non-specific toxic effect on capillaries. Stuart-Harris, Andrewes, and Smith⁶ recovered both influenza virus and *Staph. aureus* from cases of bronchiolitis during an influenzal epidemic in England in the winter of 1936-7, and regard both virus and staphylococci as important in the production of the lesion. A similar case

has been reported by Stokes and Wollman.⁷ Wollenman and Finland⁸ have recently given an account of the post-mortem findings in 8 cases of staphylococcal pneumonia following an outbreak of influenza in Boston during the winter of 1940-1: influenza A virus was isolated and an increase of anti-influenzal antibodies was found in the serum of recovered cases of pneumonia. In the three acute cases the pleural involvement was slight. In the dependent parts of the lungs multiple abscess cavities formed a "honey-comb," mainly in communication with the bronchioles, which contained tacky muco-pus. Histologically the process was an acute necrotizing bronchitis and bronchiolitis with spread to the associated alveoli; no hyaline membrane was seen, save in the single fulminating case, in which there was haemorrhagic oedema with little reaction. In the four chronic cases pleural involvement was also slight; the basal portions of the lungs contained numerous "rubbery" nodules, consisting of large cavities containing yellow or greenish-grey muco-pus, and with well-marked fibrous walls. There was extensive fibrosis between the cavities, and the trachea, bronchi, and bronchioles contained grey-green tenacious exudate, the removal of which revealed reddened but apparently intact mucosa. Microscopically the picture was one of multiple abscesses, fibrosis, and bronchiectasis. The bronchial walls were infiltrated with plasma cells, lymphocytes, histiocytes, and rare foreign-body giant cells; in the abscess cavities the process was more acute, with some persistence of necrotization. In three cases there was interstitial fibrosis and the alveolar lining was replaced by a low cuboidal epithelium. There was evidence of regeneration of bronchial mucosa, and in some the regenerating epithelium was found pinched off as isolated epithelial islets. In the alveoli the inflammatory exudate showed all stages of organization; large sheets of connective tissue extended from one alveolus to the other through septal defects. In areas of marked fibrosis and chronic inflammation there was some proliferative endarteritis. Staphylococci could be seen in sections of all the acute cases, and were recovered as the predominant organism in all eight. The authors therefore suggest from their own experience and from a consideration of the literature that *Staph. aureus* may become in influenza epidemics a dangerous secondary invader of the lungs. Until penicillin is generally available the clinician will have to rely upon sulphathiazole as a chemotherapeutic weapon against this dangerous complication. Sulphathiazole should be given in effective doses—for example, 12 grammes on each of the first two days. If the clinical condition is bad, then sodium sulphathiazole should be given intravenously.

THIOURACIL IN HYPERTHYROIDISM

Thiouracil is an important weapon for the control of hyperthyroidism. By the oral administration of thiouracil the symptoms of thyrotoxicosis can be greatly reduced in two or three weeks and they will remain in abeyance so long as the administration continues. The story of the discovery of thiouracil begins with experiments on sulpha-

guanidine by J. B. MacKenzie, C. G. MacKenzie, and E. V. McCollum,¹ who wished to see whether, in killing intestinal bacteria, sulphaguanidine would prevent the formation of essential nutrients by the intestinal flora. They observed that it affected the thyroid of the rat so that it became enlarged and hyperaemic, and, on microscopical examination, hyperplastic and colloid-free. About the same time Richter and Clisby² observed that similar changes in the thyroid followed the administration of phenyl thiocarbamide, and Kennedy,³ who was attempting to isolate the substance in rape seed which caused goitre, found that allyl thiourea caused thyroid enlargement in rats and changes in the anterior pituitary.

The MacKenzies' first detailed paper⁴ describes the effects already mentioned and also demonstrates that daily consumption of sulphaguanidine causes cellular changes in the anterior pituitary, together with a fall in the basal metabolic rate. In the anterior pituitary the eosinophil cells decrease in number and the basophil cells are vacuolated and enlarged. The simultaneous administration of sodium iodide does not prevent these changes, but that of thyroxine does. While the MacKenzies thus made the original observations, the further development of the subject and the clinical application of thiouracil have been due to E. B. Astwood and his colleagues in the department of pharmacology at Harvard. In their first paper,⁵ which appeared side by side with that of the MacKenzies, they confirm the MacKenzies' conclusions and show that sulphaguanidine does not cause thyroid enlargement in hypophysectomized animals. Astwood *et al.* put forward the explanation that under the influence of sulphaguanidine or thiourea the organism is unable to synthesize the thyroid hormone at a normal rate, so that a deficiency of this arises. Because of this deficiency the anterior pituitary secretes more thyrotrophic hormone, and this hormone causes thyroid enlargement and hyperplasia. Astwood⁶ then made a study of 106 compounds to determine their relative activity in causing thyroid hyperplasia, and also to determine their toxicity. He found that the sulphonamides were all active, sulphadiazine causing hyperplasia in the very low dose of 4.2 mg. per 100 g. body weight daily; sulphanilamide, on the other hand, acted only in a dose of 70 mg. per 100 g. Other potent substances were *p*-aminobenzoic acid, potassium thiocyanate, and many derivatives of thiourea, of which thiouracil—which is $\text{NH.CS.NH.CO.CH:CH—}$ —a thiobarbituric acid were the most important. Because of their low toxicity, Astwood concluded that thiourea and thiouracil were the most suitable for clinical trial.

The hypothesis put forward concerning the action of these compounds by Astwood *et al.*⁵ was supported by the observations of Dempsey and Astwood⁷ on the effect of temperature. They found that if rats were kept at 35° C. thiouracil had almost no effect in causing thyroid hyperplasia. On the other hand, if rats were kept at 5° C. thiouracil had much more effect than if the rats were kept

at room temperature. The observations fitted in with the conception that the hyperplasia was not the direct effect of the thiouracil on the thyroid gland, but was the consequence of the stimulation of the anterior lobe of the pituitary body by the lack of thyroid hormone. The lack of thyroid hormone is a much more effective stimulus at low temperature. Dempsey and Astwood also showed that when thyroxine was given together with thiouracil, at a room temperature, doses of thyroxine less than 5.2 microgrammes daily did not prevent thyroid hyperplasia, whereas doses greater than this not only prevented hyperplasia but actually led to diminution in the size of the gland. Evidently these doses were greater than the normal thyroxine production, and diminished the activity of the pituitary anterior lobe. By finding the daily dose of thyroxine which at any given temperature maintained the weight of the thyroid gland unchanged when thiouracil was being administered they were able to calculate the normal daily thyroxine production of the gland at that temperature.

In May of this year Astwood⁸ described the effect of thiourea and thiouracil on patients with thyrotoxicosis. Since he found that thiourea produced nausea and gave the patient's breath an unpleasant smell he gave up its use in favour of that of thiouracil. He found that both thiourea and thiouracil caused a fall in the basal metabolic rate provided they were administered for 3 weeks or longer; there was a corresponding fall in pulse rate and rise in body weight and in serum cholesterol (e.g., from 84 to 206 mg. per 100 c.cm.). When the thiouracil was discontinued the B.M.R. again rose. The dosage of thiourea was 1 to 2 g. daily, and that of thiouracil 0.2 to 1 g. daily. In one patient an unnecessarily high dose of thiouracil, 2 g. daily, produced agranulocytosis, but the patient recovered. The initial dose recommended is 0.5 g. daily, to be lowered as the B.M.R. falls.

These clinical results of Astwood's have been confirmed in America by Williams and Bissell,⁹ and recently in England by Himsworth,¹⁰ so there remains no doubt that the introduction of thiouracil represents an important step in the treatment of thyrotoxicosis. It is strange that a substance which causes thyroid hyperplasia in a normal animal should be used to inhibit the effects of hyperplasia in thyrotoxicosis. However, both in the normal animal and in thyrotoxicosis thiouracil prevents the formation of thyroid hormone. In the normal animal the diminution in thyroid hormone leads to pituitary stimulation and thyroid hyperplasia. In thyrotoxicosis the diminution in thyroid hormone leads to a fall in the B.M.R. and an amelioration of the patient's symptoms. Probably in thyrotoxicosis the thyroid hyperplasia will not be seen because thiouracil is given in a dose sufficient only to reduce the B.M.R. to normal. The longest period for which Astwood has given thiouracil to a patient is ten months (that was two months ago); administration for this time produced no ill effects. When in another patient administration was discontinued after two months the B.M.R. returned to the previous high level, which

gests that continued administration is necessary to control hyperthyroidism. At present the treatment is being carried out in Massachusetts General Hospital, and doubtless other hospitals, as a preliminary to surgical intervention but not as a substitute for it: time will show whether thiouracil will replace the surgeon's knife in the treatment of hyperthyroidism.

VIEWS ON A MENTAL HEALTH SERVICE

The Royal Medico-Psychological Association has issued a series of recommendations setting forth its views on a mental health service. It is in favour of regionalization, and recommends that a Mental Health Committee be set up in each area to take over all mental health activities, with a Medical Advisory Committee "fully representative of those practising psychiatry in the area." An administrative-medical officer of mental health of equal status with the medical officer of health is also recommended. The association is uncompromising in its assertion that the medical superintendent of each mental hospital should continue to be in absolute charge of his institution. The idea of a dual authority consisting of an administrator on one hand and medical director on the other is ruled out. Any possibility of an organization similar to that obtaining in the general teaching hospitals is not mentioned; nor is anything said in the recommendations as to the responsibilities of superintendents with regard to the postgraduate training of the staffs. But it is impossible in a short statement of main principles to cover all the ground. The report recognizes the need for psychiatric beds in each general hospital and suggests 6% of the total bed accommodation as desirable. While emphasizing the need for mental nurses to staff these clinics—or "units," as the report prefers to call them—it does not allude to the possible affiliation of mental with general nursing, and presumably therefore, by implication, is not in favour of a unitary scheme. The report does not commit itself on the question of the allocation of types of patients between the psychiatric unit or clinic and the mental hospital. Apparently it is felt that each is suitable for the treatment of all types. There is probably room for variety based on local experience on this score, especially as in the course of time the increased intercourse between the staffs of mental hospitals and psychiatrists outside them will tend to ensure that the individual patient goes to the place that is actually most suitable for him at the time. The report recognizes the existence of psychiatric consultants other than those on the staffs of mental hospitals and psychiatric units, but it does not suggest any machinery by which they might be recognized.

One of the most important recommendations made by the association is that certification in the form of a reception order should be abolished for non-voluntary first admissions for at least six months. This recommendation is made in conjunction with the suggestion of increased powers for the Board of Control reorganized and renamed as the "Board of Mental Health." While in fact the report envisages increased liberty for the patient and increased facilities for treatment it also implies an increase of regimentation in the ranks of medical men in a mental health service. Important recommendations are made for increase in the provision for the care and education of dull and defective children. A special note is made on the need for hostels and the like for the care and treatment of difficult children. "Child psychiatry" is included under a separate heading, but presumably it is not intended that

a children's psychiatric service and one catering for the subnormal children should be separate and distinct. In general the report provides a comprehensive basis for discussion.

CHILDREN IN HOSPITAL

The belief that illness is caused by malign agency is deep-rooted in the history of the world. In England, not so long ago, witches were burnt for this reason, while to-day among primitive peoples there are many who still look upon disease either as the hostile act of an ill-wisher or as a punishment for sin. In children something of the same feeling exists as in these child-races. Piaget has noted that the conception of chance is absent from the mind of the young child, who interprets what happens to him in terms of the omnipotent parents of his fantasy. So in the case of bodily disorder he feels as if his parents are letting him be ill to punish him for angry, hostile impulses, whose importance he exaggerates, and for which, if he is sent to hospital, he feels cast out. Where parental visits are forbidden, their absence serves strongly to reinforce his sense of loss and guilt. In a series of 44 cases Dr. H. Edelston¹ has traced the onset of neurotic disorders following stay in hospital. Symptoms include night terrors, sleep-walking, fears, abnormal clinging to the mother, facial twitches, soiling, and behaviour difficulties. In each case it was found that the twin traumata of illness and loss of parents had struck at the roots of the child's love-relationships upon which his sense of security was based, for he could no longer feel sure that his parents' love would protect him from harm, or that they would not reject him (as it seemed) in his hour of need. The younger the child the more acute these anxieties, except where frequent visits had been permitted. Although obviously there are many children for whom a period in hospital is not an emotionally traumatic experience, the fact that this can be so may shake the complacency with which medical and nursing staffs are wont to regard the Tommies and Toppies of the children's ward, and to assume that the disturbing influences of father and mother are better excluded. Certainly they can be disturbing, because a child who fears he is rejected may on the one hand test his mother's love by difficult behaviour when she appears, and on the other hand be distressed at again losing her when she leaves. These reactions are but eruptions discharging on the surface which serve to prevent the malady from becoming deep-seated. Better a half-hour of uproar or a passing rise of temperature after visiting hours than a future of neurosis!

ARSINE POISONING

The haemolytic effect of arsine (AsH_3), sometimes causing death by acute and extensive destruction of red blood cells, has long been known. Many such industrial accidents, especially in the course of processes involving extraction of ores contaminated with arsenic, have been reported, and where necropsy has been performed the "haemolytic syndrome" has been found to be associated with engorgement and blocking of the tubular system of the kidneys. The problem of the mechanism of the haemolytic action of arsenic has recently had much light thrown upon it by the investigation² of three cases of acute haemolytic anaemia, one fatal, occurring in workers in the fertilizer industry. Their occupation—that of unloading from the

¹ *Genetic Psychology Monographs*, 1943, 28. Provincetown, Massachusetts, U.S.A.

² Wilson, R., and Maugun, G. H., *Southern med. J.*, 1943, 35, 212.

hold of a wooden schooner fish-scrap used as a source of ammonia nitrogen—did not at first suggest exposure to arsine. The evidence for such exposure, since arsine was not demonstrated in the air of the ship's hold, rested chiefly on the facts that arsenic is present in fish-scrap, that the atmospheric and bacterial conditions in the ill-ventilated hold would tend to favour development of arsine, and that all three workers, with the same immediate occupational history, developed the same haemolytic syndrome. The active haemolysis was demonstrated by a technique of precipitation with ammonium sulphate, re-solution and dialysis, in the protein fraction of the blood in one case and the urine in another. In the blood it was present only in the case in which tests were carried out immediately after exposure to arsine. The haemolysis found in the urine, though the urine itself contained large amounts of arsenic, was entirely free from arsenic. It is suggested therefore that arsenic, after absorption through the lungs, enters into some loose chemical combination with protein in the serum or in the red blood corpuscles, this combination conferring on the protein an active haemolytic property independent of the presence of arsenic itself. In the early stages of the intoxication the haemolysis is present in the blood and is later excreted in the urine. In the fatal case—in which by mistake the administration of alkali was omitted—death took place from clinical uraemia, and examination of the kidneys showed blocking of the collecting tubules by haemoglobin casts. Two necessary measures for prevention of similar fatalities emerge from this investigation: first, the adequate ventilation of ships' holds where fish-scrap is unloaded; secondly, the administration of alkalis in cases of acute haemolytic anaemia in order to minimize the precipitation of haemoglobin in the tubules of the kidneys.

FRIENDS IN NEED

To turn over the pages of the fourth annual report of the Friends' Ambulance Unit is to turn over the pages of a gazetteer—Norway, Egypt, Greece, the Middle East, Syria, Ethiopia, India, China, and now North Africa, Sicily, and Italy—evidence that this body of some 800 men and women who, though unable to reconcile their beliefs with war, nevertheless "go wherever the need is greatest to give disinterested service in the relief of suffering." During the past year thirty-seven members of the unit have provided about a third of the personnel of a mobile military hospital in the Middle East, which has served as an evacuation centre, a forward casualty clearing station, an emergency hospital, and a clearing base for all the seriously wounded. This hospital worked in the desert without pause from November, 1942, to June, 1943, from Cairo to Tunis. Members of the F.A.U. were at hand in India at the time of the devastating Bengal floods in October, 1942, to help with inoculations, nursing of cholera cases, and the distribution of food. Again, in the autumn of 1943 the unit organized canteens in the Bengal famine, and was responsible for distributing powdered milk to 20,000 people in Calcutta and district. While the work of the F.A.U. increases abroad, Quakers at home have turned their attention to the possibilities of relief on the Continent of Europe. Six members who were captured in Greece were among the repatriated prisoners reaching home last October; the remaining ten continue to work as masseurs and orderlies in prisoner-of-war camps and hospitals in Germany. Members of the unit are unpaid, receiving only their keep, equipment, and small allowances towards the necessities of life. About one-half of the unit's total expenditure is now met by contributions from those for whom it works; the remainder must come

from subscriptions and donations, and an appeal is made from 4, Gordon Square, W.C.1, for £30,000 to see the unit through the financial year 1943-4.

WAR ON THE BROWN RAT

The beginning of December saw the outbreak of another war, in which the enemy was the brown rat (*Rattus norvegicus*), the inhabitant of London sewers. It is estimated that the rat damages national food stocks to the extent of 2,000,000 tons a year, equal to the carrying capacity of many cargo ships. Therefore the Ministry of Food, in co-operation with the Ministry of Agriculture, taking the lead in its extermination; but the campaign has an interest from the public health point of view, because the rat is a disseminator of disease, particularly, in the case of the brown rat, of spirochaetal jaundice affecting seamen and miners who come in contact with its excreta and with stagnant water which it has fouled. Since October 14,000 reports have been received by the Ministry of Food from members of the public in London and the Home Counties furnishing evidence of the whereabouts of rats and by piecing together the reports from a particular area a fairly good map of rat territory is obtained. Observation of smears, droppings, and damage locates more closely the whereabouts of the colonies. The first stages of the campaign are directed to the 3,000 miles of London sewers. The sewer rat and the surface rat are closely allied, and it has been shown that if the former is dealt with adequately the surface rat population is depleted. Almost invariably the territories in which the sewer rat is reported are the areas also of surface infestation. To assist in rat control the Ministry of Food is employing 16 young women trained in its Disinfestation Division in Gower Street, who give lectures to rodent officers, sanitary officials, and others who will have the work in hand. The measures taken for the extermination of rats once their presence is known are the result of the experimental work carried out by the Bureau of Animal Population at Oxford under the auspices of the Agricultural Research Council, and have been already employed successfully in the docks and warehouses of the Port of London. An attractive unpoisoned bait of whole wheat or waste bread soaked in water is built up, and after a few days is replaced by a poisoned bait. Red squill is the most effective poison, but is difficult to obtain now in large enough quantities. The poisons used are zinc phosphide, which is mixed with the moist bait in the proportion of 5% by weight, finely powdered arsenious oxide, in the proportion of 15%; or barium carbonate, 20%, this last mixed intimately with sausage rusk or bread mash. Most of the rats die in their runs, but when zinc phosphide is used a number may be found lying out in the open. To ascertain whether any rats remain, a system of post-baiting is recommended, using an unpoisoned—and a different—bait. All care must, of course, be taken to prevent the poisons from becoming mixed up with the foodstuffs or from being left in places to which children or domestic animals have access. The rat-catcher's chief responsibility begins after the "kill," when it is his business to dispose of the waste poison baits as well as of such rat corpses as can be found. A rat campaign is very like war in that if it is to be waged at all, it must be waged rigorously. As Dr. M. T. Morgan, medical officer of health, Port of London, points out in an article in the *Monthly Bulletin* of the Ministry of Health, much money and energy are wasted on enterprises claiming rodent elimination which do no more than touch the surface of the rat population, while the more shy or more cunning survivors continue their depredations and maintain or increase their numbers. The aim must be the total elimination of the rat colony.

PHOTOMICROGRAPHY WITH ORDINARY CAMERAS—A SIMPLE TECHNIQUE

BY

W. N. LEAK, M.A., M.D.

The description of a little-known method which enables anyone who knows how to use his microscope to obtain photomicrographs—which will compare reasonably with the work of elaborate equipment—ought to be of more general interest now than in peacetime, as so many doctors are working in unusual circumstances. The basis of the method depends on the fact that a camera will take a photograph of a "virtual" image—e.g., a reflection in a mirror—as easily as it will that of a "real" one. The image seen in the eyepiece of a microscope is a virtual one, and the results which can be obtained by the method described depend largely on the fact that practically all microscopes work best when the image is viewed in this way. It is relatively seldom that they are so used even in the most expensive photomicrographic equipments; even the projection oculars are to some extent a makeshift, though much better than the ordinary Huygenian type occasionally used as such. The microscope objective is so constructed that it gives its finest optical results when used with a definite tube-length and the image turned into a virtual one by the eyepiece,

focus for infinity thus fixed. If this gadget is then put in front of the eyepiece a small part of the image will be seen through it correctly focused. If the image is somewhat blurred a touch on the fine adjustment will bring it into correct focus. Once it has been found, as it may, that the operator's eye is emmetropic and no adjustment of the fine adjustment is needed, it is not necessary to repeat this manoeuvre every time unless lighting conditions are trying or one is doing a great deal of close work. In these conditions the focus of the eye is liable to alter sufficiently to make some slight correction necessary, though I personally have not found the need for it. If, on the other hand, the operator is myopic and wants to take a number of photographs one after the other, a simpler way is to focus the viewing gadget to show a sharp image with the microscope focused as the operator normally uses it, and then turn the gadget on to some object in the room which shows in sharp focus, and measure its distance from the gadget itself. This will give the correct distance of the virtual image, and if the camera is focused for this distance the resulting photographs will be sharp without further adjustment of the microscope focusing.

Position of Camera Lens

The next point is to see that all the light coming through the eyepiece enters the camera lens. In order to do this it is important that the camera lens should be close to the eyepiece and the lens diaphragm opened as wide as possible. Closing the diaphragm will not increase the sharpness of the picture; it will merely limit the field of view. One might mention here that, though reference has been made throughout to a microscope, the method is just as applicable to any other optical instrument using an eyepiece which gives a virtual image—such as a telescope, spectroscope, range-finder, or even a field-glass, through which, with care, excellent telephotographs can be taken. Care should naturally be taken that there is no dust on either eyepiece or lens to scatter the light and so cause unwanted fog. For this reason, also, the simple triplet type of anastigmat—such as the Zeiss Tessar, the Leitz Elmar, and the Aldis—is probably the best, as with this type unwanted reflections and flare spots are less likely to occur. However, nearly any type of anastigmat will serve, as well as any type of camera. The focal length of the lens is of some importance: the longer the focal length the larger the resulting photographs, the less the need for enlargement, the larger the plate or film required, and—a very great disadvantage—the longer the exposure needed.

Placing the camera so that it is truly in line with the microscope tube is not a difficult matter. It can be gauged by the eye accurately enough for all purposes, and with the tube horizontal one can in a minute or so make up a pile of books of the right height, get the camera out of its case and place it firmly on them, and take the photograph. If the tube is to be kept vertical some sort of stand for the camera must of course be used, and once this is fixed, or a block of wood made the right height for the horizontal tube, the operation is even simpler still. It is wise, though not always necessary, to put a cloth or collar round the junction of the eyepiece and the lens to exclude extraneous light, and unless a wire release is used it is best to make the exposure by putting a card between the illuminant and the microscope stage, open the shutter, and then, when everything has settled down again, give the exposure by removing the card for the time required, closing the shutter after the card has been replaced or, alternatively, switching the electric illuminant on and off—that is, unless a slow instantaneous exposure is required.

Exposure and Development

Judging the exposure is not very difficult after a few trials. Most modern films will give a reasonably good print if not over-exposed more than about five or even ten times; so if one is in doubt and is using a miniature camera with its cheap film, it is best to give two exposures—one perhaps a third what one estimates, and the other about ten times as long. One or other of these exposures should give a nearly perfect result. Where exposure needs to be exact is when photographing unstained objects such as diatoms. Using a 2-in. lens, one may say roughly that if with artificial illumination the image is uncomfortably bright and gives a feeling of glare, a fast film such as Selo H.P.2 will require about 1/10 second,

Trichinella spiralis encysted in infected pork.
(Low power—1 in.; $\times 100$ approx.)

and the virtual image thus formed is focused at infinity—i.e., as seen by an emmetropic eye completely relaxed. This is the normal and ideal position, though a person with hypermetropia or myopia will naturally focus the image at the most comfortable distance for himself.

In this ideal position clearly the conditions required for photographing this virtual image focused at infinity are that the camera itself should be focused at infinity, the lens put in such a position that all the light coming through the eyepiece enters the lens, and the camera itself put truly in line with the microscope tube. The only thing left is to make the correct exposure and develop the film or plate. For all that it is so simple—literally simple owing to the excellence of present-day microscopes, cameras, and films—a few remarks on the various points mentioned may prove helpful.

Focusing at Infinity

The first point is to ensure that the virtual image is correctly focused at infinity. The simplest way of doing this is to construct a small viewing telescope of low power with which to view the image. This is easily done by sticking a small magnifying-glass of about 4-in. focus—non-achromatism does not matter—at the end of a short tube of cardboard, etc., and sliding into the other end a spare eyepiece from the microscope. This should then be focused on some distant object and its

a slow film such as F.P.2 needing five times as much. Using daylight as an illuminant is a more tricky matter even with the help of an exposure-meter. Naturally, a panchromatic film should be used, and the best illuminant is an opal—not pearl—electric bulb of about 40 watts. Except for the lowest powers the illuminant should be correctly focused on the slide by a substage condenser, and those who have not used one will be surprised by the improved definition obtained when an achromatic condenser is employed instead of the ordinary Abbé. One advantage of this type is that with the top lens removed it usually makes an achromatic condenser of longer focus admirably suited to work with a 1/6-in. or lower power. When out of reach of electric light the side of an oil-lamp flame, correctly focused, is probably still the finest illuminant possible, and, as shake here is unlikely, the longer exposures required are not of much consequence.

The only point requiring special notice as regards development is the degree of contrast desired. In this case it is not a question of obtaining an artistic print but one which will show clearly the structures involved. Until ciné colour film becomes available once more we have to differentiate in a photograph by the use of contrast instead of colour-staining. Therefore films should usually be well developed to give as wide a contrast as possible without, however, in the case of miniature cameras, going so far as to increase grain size. We must use panchromatic film, which reproduces the brighter colours very much alike, and for this reason the use of colour-filters to bring out contrast is most desirable. For difficult work the skill of the photographer will be shown by his judicious use of these more than by anything else. Fortunately the filters do not need to be optically worked like those used on cameras, as they should be placed between the illuminant and the condenser. An opal bulb gives rather a reddish light, so the factors for blue filters will be decidedly more than they would be for half-watt lighting, and very much more than for daylight.

Conclusion

Many variants and developments of the general idea given here can be worked out. The owner of a twin-lens reflex, for example, may prefer to focus the image through the top lens before taking the photograph through the lower one. The fortunate owner of some high-power binocular microscopes might like to set his camera semi-permanently over one of the eyepieces, viewing down the other and snapping as often as he pleases. In the same way serial views through the thickness of a section or animal may be taken with the utmost economy of time and material by just moving the fine adjustment a definite amount on each occasion; and views, say, of the disposition of chromosomes in three dimensions or of the internal organs of an insect obtained in a very short time. When peace comes, students, who are often keen photographers, may by this means be helped to take a greater interest in many of their pathological and other slides by photographing them. In fact, the possibilities are as endless as the uses of optical instruments themselves; and even though the result may not invariably be first-class they should always be presentable and certainly full of interest.

The accompanying photograph, taken with a miniature camera, will give an impression of the work which can easily be done.

BIRMINGHAM HONORARY STAFF

In the latest annual report of the Birmingham United Hospital (which includes the General Hospital, founded in 1766, and the new Queen Elizabeth Hospital at Edgbaston, founded in 1938) the Board pays a grateful tribute to its honorary medical and surgical officers, upon whom heavy burdens have fallen. They are discharging important duties under the Ministry of Health, requiring frequent visits to many outlying hospitals, and yet they have continued to serve the United Hospital unsparingly. It is mentioned that as a body, speaking through the Medical Committee, which is composed solely of members of the staff, they have consistently refused to accept any portion of the funds derived from contributory schemes. From time to time there has been set aside a small percentage—at present 1%—of maintenance fees paid by the ordinary non-contributory patients. The small sums so accumulated have been applied by the Medical Committee in furtherance of the interests of the hospital. Officers who have been marked out for staff appointments have received financial help in undertaking postgraduate studies

in important medical centres in Europe and America, and in addition new scientific equipment has been bought for the hospital from a fund. It is stated to be the desire of the staff that the question of adequate payment for services rendered shall remain in abeyance until such time as the Royal Colleges of Physicians and of Surgeons or the British Medical Association have expressed their views, as proposals have been put forward which would operate on a national or at least a regional, basis.

The honorary medical and surgical staff of the Birmingham United Hospital numbers 36, and in addition there are 15 honorary consultants. The normal capacity of Queen Elizabeth Hospital of 5 beds has been temporarily increased, and the average occupancy during the year covered by the report was 592. At the General Hospital, working within a limit of 160 beds, 6,240 in-patients were admitted during the year. The comparable figure for the last pre-war year, when three times as many beds were available, was 1 upon 8,000, so that more than three-quarters of the number of patients have been treated in one-third of the beds—meaning a quicker turnover and the use of the hospital only for the acute stages of illness with consequent heavier work for the nursing staff, to whom a tribute is paid for its "admirable spirit of cheerful service."

UNCOUNTED LONDON

For the first time in its history it is not possible to state the population of London. The London citizen may from the superficial aspect of its streets conclude that it is more crowded than ever, but the statistician is silent on the subject, saying only that the population is much smaller than before the war. The absence of this governing figure takes away much of the value of the statistics which are given in the report of the London County Medical Officer of Health for 1942.¹ We are told, for example, that the deaths of Londoners during that year were 7,500 fewer than during the year before, and the birth rate 7,000 more, but the rates per 1,000 of population cannot be given. The picture of the infectious diseases incidence is little more clear, since the heaviest incidence is among children and it is known that the child population has increased. The number of elementary school children went up by 72,000 during 1942, and that fact must be borne in mind, otherwise an increase of nearly 9,000 in the number of notifications of measles and of 2,000 in those of scarlet fever would be misinterpreted. In general, the pattern of the health of London repeats that of the whole country. Deaths from influenza, rheumatic fever, pneumonia, and infectious diseases showed a gratifying decline. Infant mortality fell to 50 per 1,000 births, although that figure is above the record low rate in 1939 of 47. The rate of maternal mortality fell to 2.51, but in 1939 it was 1.97. It is worthy of note that of the 40,000 births in London 12,000 took place in the Council's hospitals, and 11,000 others were attended by midwives under the Council's domiciliary scheme. Figures are never quite what they seem, and the deceptiveness is increased in the confusions of war. From a superficial study of the figures for attendances at the venereal diseases clinics in London one would suppose that venereal diseases were declining. The total of new cases in males seen at the clinics in 1942 was just half of what it was in 1938, but the clinics deal mainly with civilians who, at the young ages, 18 to 30, are not nearly so numerous in London, especially the men, as in pre-war years. Another factor to be borne in mind is the success of the drug treatment of gonorrhoea, which means that many patients who formerly attended the public clinics are now treated by private practitioners. "There is little doubt," says Dr. Allen Daley in his report, "that for each sex the incidence rate is increasing." The school medical service of London assumed a more normal shape during the fourth year of war with an elementary school population increasing from 148,000 at the beginning of 1942 to 220,000 at its close. An examination of 88,000 children in the five age groups (that is, on entering school, at 7, at 11, and at 13 plus) was carried out, and unsatisfactory nutrition was covered in 6.2%, being almost the same proportion (6.6%) in 1938, when the examination covered twice the number of children. That the nutritional condition of the great majority is satisfactory is attested by some independent observers, and others by Dr. Sydenstricker, an American authority on deficiency diseases, who, at the request of the Ministry of Health, made a sample examination. In the examination of the 88,000

¹ London County Council. *Interim Report of the County Medical Officer of Health and School Medical Officer for the Year 1942.* (6d., post free 7d.)

children obvious decay of the teeth was found in 36% and defective vision (6/9 or worse) in nearly 24%. There was a welcome improvement in the cleanliness of the hair and also in the incidence of skin diseases, which was only 2%. Finally, the mental health services are the subject of a short section of the report. The number of mental patients in London continues to fall. At the end of 1942 the inmates of mental hospitals and institutions for mental defectives totalled 31,400, being 3,000 fewer than at the outbreak of war. The same decrease was noted in the last year, and it is not limited to London. Possibly, with full employment and lessened economic stringency for many individuals and families, many mental breakdowns are averted.

SOCIAL MEDICINE IN SCOTLAND

The Englishman may well have begun to wonder why Scotland has been able to initiate a number of experiments in social medicine since war began, and the Department of Health, in the opening pages of a pamphlet describing these experiments,¹ acknowledges that the accommodation available in E.M.S. hospitals has made much of the work possible. The Clyde Basin experiment, for example—remarkable because it is directed to maintaining the health and efficiency of young civilian workers—was made practicable because beds were available at two base hospitals—Law and Killearn—in addition to convalescent-home accommodation. The patients are referred for overhaul by their own doctors, and are examined by consultants where necessary; if further examination is required they are admitted to E.M.S. hospitals, or they may be sent for convalescence to one of the auxiliary hospitals. In one year 1,400 young people were dealt with under the scheme, and by the end of June, 1943, that number had risen to 4,126. A detailed analysis of the first 1,200 cases shows that some 40% were admitted to hospital for investigation and 14% sent to convalescent homes. The great majority of those patients suffered not from serious organic disease but rather from vague ill-health of the nature of debility, anaemia, and anxiety states, the result of continued strain. The Department concludes from a general review of the working of the scheme that:

"(1) There is need for facilities such as are provided under the scheme, though not necessarily on exactly the present lines—admittedly experimental. (2) At present too many of the cases of fatigue carry on until unfit for work, when the period required for return of capacity is prolonged; more adequate facilities for ordinary—e.g., week-end—rest and recreation would help to prevent some of the conditions found. (3) Much of the vague ill-health encountered was due to long hours of work, travelling difficulties, and inappropriate dietaries as evidenced by the large proportion of cases without serious organic disease. (4) The vast majority of the patients sent for convalescence have benefited by the rest and change provided; the removal of fears of serious disease by complete medical overhaul provides the reassurance so helpful in expediting recovery. (5) The hospital reports must be of value in affording to the patient's own doctor a useful background not only for present but for future reference. (6) The proportion of cases with early organic disease elicited in the course of hospital investigation but not detected by ordinary clinic and specialist facilities is small; where institutional admission can be most helpful in such cases is mainly in the elucidation of causal factors."

Among other work described in the pamphlet is a study of the health and working experience of men and women invalided from the Forces. It was found that 65% of the men received attention from their own doctors and 16% hospital care for the condition responsible for their discharge within 6 months of returning to civil life. Six months after leaving the Services 16.5% were unemployed, 40% were doing their old work, and 43.5% had taken up new work; 39% reported they were having difficulties, and the nature of those difficulties showed how intimately related were their medical, social, and occupational aspects. An investigation into long-term incapacity for work, the steps taken to reduce waiting lists of voluntary hospitals, and the Gleneagles Fitness Centre are also described in the booklet. Of the last named the Department says it is as yet too early to assess its value, but from the enthusiasm of the patients and their co-operation it is obvious that the centre meets a real need.

THE RENEWAL OF CIVILIZATION

PROBLEMS OF FEEDING EUROPE

It is hardly to be wondered at if, after four years of international violence, any sign of the reversing of the engines is regarded with scepticism. The Atlantic Charter evoked hope and cynicism in about equal parts, and now the plans which are being constructed by the United Nations for the relief and rehabilitation of the victims of war attract less interest than some minor episode of the fighting. Yet there will come a time, soon or late, when those plans will be the topic of general conversation; they will seem as paramount as the prosecution of the war seems now, and eighty millions of our national income will probably be spent upon their furtherance.

At Washington early in November forty-four nations signed a draft agreement for a Relief and Rehabilitation Administration. They are called the United Nations, but, strictly speaking, the United Nations number thirty-three; there are ten others, chiefly Central and South American States, associated with the United Nations in the war, and there is the French Committee of National Liberation, making the forty-four. The purpose of the Administration is to meet the basic needs of the victims of war in the territories controlled by the signatories, including the areas liberated from the enemy. The preamble of the agreement ordains that immediately upon the liberation of any area the population shall receive aid and relief in the shape of food, clothing, shelter, and measures for the prevention of pestilence and recovery of health. At the conference which has taken place lately at Atlantic City, Dr. T. H. Parran, Surgeon-General of the U.S. Public Health Service, stated that reports from France and Poland in particular indicate the need for swift moves to counter the spread of epidemics, especially of typhus and tuberculosis. As many as 21,000,000 people will, in his computation, be returning to their homes. He stated that teams of physicians and technicians, each team capable of dealing with a group of 10,000 persons, were being organized and medical supplies accumulated. The returning people will be passed through centres where they will be examined for contagious diseases and will be vaccinated and, if necessary, put in quarantine.

A council, representative of the principal Governments, is created by the agreement, with power to establish general policies. It will receive reports and recommendations from standing committees, including one for Europe and another for the Far East, and there will be a central body composed of representatives of the United States, Great Britain, Soviet Russia, and China for emergency decisions. The agreement is an instrument of ten articles, one of which deals with the appointment of a Director-General, who will have power to carry out relief policies. The American Secretary of State, Mr. Stettinius, says that in the course of the negotiations he has learnt the great importance which all the united and associated nations attach to this project and their eagerness to make the utmost possible contribution. It will certainly all be needed if any halt is to be called to the spectres of famine and plague which not only accompany war but follow for long in its wake. It is to be hoped that this instrument will be more effective than the League of Nations Covenant, the penultimate article of which called upon the members of the League to encourage and promote the improvement of health, the prevention of disease, and the mitigation of suffering throughout the world.

Famine Conditions in Belgium

Meanwhile the Famine Relief Committee in London has issued, above the signature of Lord Horder, its chairman, a report on conditions in Belgium, from which, of all the famine countries, the evidence is most complete. The calorie value of the official basic ration in Belgium per day is 1,280, less than half of that required for health, and about half of that which obtained during the last war, when Belgium also was an occupied country. Infants and workers receive a supplementary ration, but large sections of the population have to depend upon the basic figure. Lord Selborne, Minister of Economic Warfare, has questioned these figures, but he admits that large groups of the population receive an average daily allowance no greater than 1,550 calories. One of the most striking evidences of dangerous undernutrition is the occurrence

of hunger oedema, which has been seen in some of the refugees, not of the poor class, who have arrived lately in this country.

A report by Prof. Heymans of Ghent, made a year ago, gave the consumption per head per day of the Belgian people in 1939 as 2,868 calories, compared with present rations, including supplementaries, of 1,450 for children of 6 to 14, and 1,230 for adolescents of 18 to 21. It is stated that in Liège a daily ration of 1,300 to 1,500 calories has resulted in an average loss of weight of 12% in the individuals attending the polyclinic of the university. Apparently there is no striking rise in infant mortality. In 1939 the rate was 73 per 1,000 births, and in 1942 it was 78 (it is not clear whether these figures relate to the whole country or only to certain maternity clinics). A supplementary ration is allowed to tuberculous persons, and during the first six months of 1942 the number of persons receiving such allowances rose from 69,000 to 88,500. Heymans says that if the Belgian people continue to be undernourished tuberculosis will assume more and more a catastrophic character, causing a fatal enfeeblement of the race. A great shortage—in some cases a complete lack—of necessary drugs began in 1941, and in view of the embargo afterwards imposed by the British Government there is an element of tragedy in Heymans's further statement that "we are permitted to entertain certain hopes of still more important arrivals of medicaments."

Famine in Many Lands

Some further light on the European situation was afforded at a conference called recently by the London Area Committee of the Association of Scientific Workers. Another Belgian authority, Dr. A. Marteau, gave an account of the situation in actual weights of food, not calories. Millions of Belgians, he said, now exist on a daily ration of 1/2 lb. of poor-quality bread, a few potatoes, and occasionally a tiny piece of meat. At the same conference conditions in Czechoslovakia were described by Dr. V. Kruta, who said that in that country the rations are deficient in energy value by some 500 to 800 calories a day for all classes of consumers; they are deficient also in protein and in vitamins, especially A and D. Here again an alarming increase in tuberculosis is recorded, as well as a rise in general and infant mortality. The occurrence of a new skin disease suggestive of vitamin A deficiency is mentioned.

Greece still presents a dire spectacle of famine. Dr. A. Cawadias gave the conference an account of the intense famine periods, separated by certain lulls, since the occupation. The arrival of some cargoes of foodstuffs gave a restricted relief, and brought down the terrible mortality and morbidity, but the occurrence of some epidemics, especially of dysenteric diseases, and of typhus in Athens and elsewhere, has confirmed what was already known—that the effects of famine do not cease with arrival of food. During 1943 continued malnutrition in Greece has resulted in a great increase of malaria, hunger oedema, and tuberculosis.

The task before the U.N.R.R.A. is certainly formidable, and, as Prof. J. R. Marrack urged at the conference, it is most important that it should have power to acquire stocks and control of shipping and internal transport. Certain lessons and warnings may be gathered from the end of the last war, when the relief given was twice blessed, because although the giver—mainly the American taxpayer—was not repaid, the cost to him was less than that of the dislocation of economy which would have occurred if the farmers in the United States had been left with the stocks on their hands. But supplies last time were, nevertheless, inadequate; they were not based on physiological needs, which then were not so well understood as they are now, and they were mainly just what happened to be surplus.

COMMUNAL RESTAURANTS

St. Louis, 400 years ago, predicted the communal restaurant. He pictured the whole of the citizens of the ward coming at appointed hours to dinner or supper, saying that it was "a folly to take the pain to visit a bad dinner at home when they might be welcome to good and fine fair so nigh at hand at the hall." The 2,000 public canteens dignified as "British Restaurants" may be the beginning of the realization of More's dream, or they may prove to be wartime developments and fade into nothingness when commercial catering is fully resumed. But we are told that rationing will continue perhaps for years after the war, so that

municipalities may continue to provide a restaurant service as they provide baths and wash-houses or parks and gardens. Meanwhile these restaurants are evoking a new social form. They are serving over half a million people every day, and it is estimated that they are probably saving 200,000 of these from the monotony of carried sandwich lunch or the inadequacy of a "snack." The communal feeding centres made their appearance during the aerobombardment of 1940. They were, spiritually, next door to the emergency centres for the relief of the homeless. It was considered a good thing to have a number of public kitchens in running order. But they have persisted and have acquired a certain pride of their own. There remains about them an element of improvisation: the staff are less professional, though not less efficient, than ordinary catering establishments, and there is a certain homeliness about the arrangements. Most of these places are controlled by the local authority, but a certain number by voluntary committees recognized by the Ministry of Food. They are not run for profit, which is not to say that they are more or less efficient than establishments which are. The Research Group of the London Council Social Service, under the direction of Mr. F. Le Gros Clark, has made a study of a cross-section of these places in London and has published the results in a sixpenny pamphlet obtainable from the offices of the Council (7, Bayley Street, W.C.1). The group found the restaurants generally bright and roomy, some of them with mur decorations, the arrangements approximating rather to the mess-room or refectory than to the traditional restaurant. The food is fresh and good, cleanly prepared and served, and cheap. The customers are drawn mostly from those who work in the neighbourhood and require a meal away from home, but there are two special categories served—housewives and elderly persons. The housewife comes, must be supposed, to eke out the domestic ration or to save fuel and kitchen work. As for aged persons, a large number of the restaurants give special treatment to old-age pensioners, who obtain their meals at a lower price and are allotted a special table or served at a special hour. No doubt many of these old people live in squalid rooms and neglect their dietetic welfare. It is no small benefit to them to have a hot meal, served by a considerate staff, and accompanied by cheerful conversation with their kind. Mr. Le Gros Clark suggests that a medical survey might usefully be made of a group of 70-year-old men and women who attend regularly at one of these restaurants and a similar group who do not. It is possible, of course, that these British Restaurants might be used, quietly, for the inculcation of better food standards. In some cases the management are said to discuss food values with their customers or even to organize demonstrations in favour of certain dishes or certain food habits, popularizing the salad, the cheese dish, perhaps even the meatless day. But up to now it is their social value and the nutritional value for large numbers of people who otherwise would be indifferently fed which merit their continuance.

Reports of Societies

SURGICAL PATHOLOGY OF RECTAL CANCER

In his presidential address to the Section of Proctology of the Royal Society of Medicine Dr. CUTHBERT E. DUKES gave a general survey of the surgical pathology of rectal cancer and analysed the results of treatment of more than 1,000 patients.

The position of a malignant tumour in the rectum made little difference to prognosis after excision provided no lymphatic metastases were present, but in cases with glandular spread the survival rates were slightly better for tumours of the upper and lower thirds than of the rectal ampulla. The size of the growth was no indication of the extent of spread, but deep ulceration was usually a sign that it had penetrated deeply. It was rare for rectal cancer to spread upwards within the bowel wall for more than a short distance above the visible margin of growth. Signs of intravenous spread had been found in 17% of operation specimens of rectal cancer, being commonest in anaplastic growths of a high grade of malignancy. Hepatic metastases were more likely to be found in the cases. The survival rates for patients with demonstrable venous spread were not so good as for those without venous involvement, but much depended on the extent of the intravascular growth. If firmly fixed and limited to the outer margin of the primary tumour it had about the same significance as isolated lymphatic metastasis, but if massive and accompanied by loose clots the passage of emboli to the liver was almost certain to have occurred. Lymphatic spread was closely dependent on the histology of the primary tumour, being rarely found in growths of a low grade of malignancy, but almost invariably accompanying rapidly growing anaplastic

tumours. Patients with one to three metastases often survived five years, but the fifth anniversary was rarely reached by patients with four or five. A survey of the extent of local and lymphatic spread in a large series of patients treated by a combined operation had shown that about half of these might have stood just as good a chance of cure if a perineal excision had been done instead. In the other half it was probable that if the surgeon had known in advance all that was subsequently revealed in the pathologist's report concerning extent of spread he would have decided that the patient stood a better chance with a combined excision.

Recurrences and Survival Rates

A survey of the results of surgical treatment in a series of more than 1,000 cases showed that most recurrences manifested themselves within the first three years after operation, and that it was very rare for a patient who had passed the fifth anniversary of his operation to die of rectal cancer. Judged on a five-year survival basis, the surgical treatment given to these patients cured approximately half of them. Rectal cancer was commoner in men than in women, though at the time of treatment the disease was generally at a more advanced stage in women. After operation the survival curves followed a similar course for three or four years, after which there were more female survivors than male.

More than 80% of cases in which growth was limited to the rectum and more than 60% of cases in which, while there was spread to perirectal fat, there were no glandular metastases, were cured by operation, but unfortunately less than half the patients at present were operated on at these stages. Once lymphatic spread had begun, the prospects of surgical cure rapidly declined. For cases without lymphatic metastases the survival rate was practically the same irrespective of the type of operation, but for those with lymphatic metastases the results of the combined operation showed an improvement of 13% on perineal excision, and with recent improvements in surgical technique this figure might reach 15 or 20%.

In conclusion Dr. Dukas said that one obvious way of improving the results of surgical treatment would be to provide more facilities for postgraduate study and the sharing of experience. It should also be made better known that in its early stages rectal cancer could be completely cured, and that even in more advanced cases surgical treatment was often satisfactory. The need was earlier diagnosis.

CONTRIBUTION OF ORTHOPAEDIC SURGERY TO HOSPITAL DEVELOPMENT

In an address from the chair of the Section of Orthopaedics of the Royal Society of Medicine on Nov. 2 Mr. S. A. S. MALKIN spoke on the contribution of orthopaedic surgery to hospital development, and took as an example Harlow Wood Orthopaedic Hospital, near Mansfield, Nottinghamshire, with the development of which he was much concerned.

Mr. Malkin recalled a paper by the late Sir Robert Jones and Mr. G. R. Girdlestone which appeared in the *British Medical Journal* in 1919 concerning a proposed scheme for the cure of crippled children. It interested him because he was then working in a military orthopaedic hospital and had become accustomed to Army organization, whereby the sick and wounded, wherever their sickness might have developed or their wounds have been received, were sent to a place where the appropriate treatment was available for their condition. He was impressed by the absence of such a scheme for civilians, whose treatment seemed to depend not on their need but on the place where their need arose. The scheme put forward by Sir Robert Jones and Mr. Girdlestone, apart from providing treatment for crippled children, suggested a small-scale experiment in hospital organization. It contemplated a division of the country into districts, in each of which would be established a country orthopaedic hospital with a system of scattered out-patient clinics, while administration and treatment would be co-ordinated by a committee working under the Ministry of Health.

In 1923 Mr. Malkin was appointed orthopaedic surgeon to the Nottingham Cripples Guild for the purpose of developing a scheme on the lines of Sir Robert Jones's national plan. The work began in a small physiotherapy clinic, but was assisted by an allocation of a few beds in a hospital fifty miles from Nottingham. Ultimately 40 patients were accommodated at this hospital, all of whom were paid for by Nottingham authorities, public or private. In the meantime a larger new out-patient department was built at Nottingham, and later six voluntary clinics were established in various centres,

each with its independent committee and responsible for the main tenance of the patients from its own area requiring orthopaedic treatment. After these clinics had been established a joint committee on which all of them were represented was formed with the object of pushing forward the provision of an orthopaedic hospital to serve the region. A site was given by the late Duke of Portland, and in 1929 a hospital of 80 beds was opened by the present King and Queen to serve Nottinghamshire and parts of adjoining counties. Additions were made to the bed accommodation, which by 1936 had increased to 155, including a small private block.

Co-operation with the State

After pointing out some special features in the planning of the hospital, Mr. Malkin said that when the war came the Ministry of Health took the view that in the North Midland region it was better to enlarge an existing institution than to create a new one for orthopaedic work. By agreement with the hospital committee the Ministry acquired in the hospital grounds certain sites on a twenty years lease for its own wards and ancillary buildings, and on these sites E.M.S. buildings were erected. With these additions the hospital was able to accommodate 355 patients; it also controlled an annexe of 50 beds used as a rehabilitation centre, and was linked with two Red Cross homes.

Apart from the cost of the E.M.S. buildings, all the capital required for the hospital had been raised by voluntary means, but the various clinic committees were expected to provide the cost of maintenance of all the patients from their areas. The staff consisted of consultants, all of whom were available as and when required and were paid for each visit, and a central staff of orthopaedic surgeons paid on a part-time basis. The latter were responsible for the work of the hospital and the clinics within easy access. A complete scheme of rehabilitation had been developed, starting with ward exercises. Recently land had been purchased on which to build a vocational training centre.

Mr. Malkin claimed that this scheme had demonstrated that hospitals controlled by voluntary committees could preserve their autonomy and yet co-operate fully with the State, and also that the service of regional hospitals could be made available throughout the region and the staff of hospitals in outlying districts be associated with the central hospital. The plan put forward by Sir Robert Jones and Mr. Girdlestone nearly a quarter of a century ago had pointed the way to a method of co-operation with the State for the provision of specialist services throughout the country, and had enabled orthopaedic surgery to make a real contribution to hospital development.

Correspondence

The Future of Medicine

SIR.—Anyone who has studied the history of our art, from the age of Hippocrates onwards, knows that, in its broad outlines, medicine shows a noteworthy parallelism with the reigning political theory and practice in each age and country. Of this I could easily, if required, adduce examples—indeed I did so in my book *Health and Conduct* published 20 years ago. But no competent medical historian nowadays will question the fact.

At present throughout the Western world—including Japan which, like Russia, is now in all essentials Westernized—standardization and regimentation of the people hold sway official justification being found in the prevalent social insecurity or in military necessity. It would therefore be absurd to expect that in this country any official or Government-sponsored scheme planned "for the better promotion of health" will not partake essentially of this principle of regimentation. The underlying idea will be that in future the *hoi polloi* will be diagnosed and treated much less as individual and much more in categories—as "cases," in fact. Accordingly, the new health centres, from which much is by many expected will necessarily come to approximate in character to sick parades, while domiciliary treatment will mean treatment of sick billets; any case obviously seriously ill will, if acute, be "rushed," and, if chronic, "shoved," into hospital. The ordinary average doctor will in future be styled M.O. He will also be no longer an individual but one of a category. His approach to each and every patient will be purely objective and one M.O. will be at any moment replaceable by another without the patient's health being in the least affected by the change.

Up to a point this sort of medical practice will work, as it does work in the combatant Services now. But just as

war itself, on however vast a scale, only works up to a point and finally breaks down as a method, so it will be with all this materialistic organization of health services. Man is by his nature an individual, not a cipher, and he expresses himself primarily in a concrete environment of actual neighbours, and only secondarily at best in an abstract one of "fellow countrymen" or even "humanity." Such is man's nature; and Nature, even when driven out with a pitchfork (*naturam expellas furcad*), has a way of reasserting herself, and sometimes, if too long pent up, with explosive and shattering violence. Galen, the medical historian and synthetist of Graeco-Roman antiquity, was for ever repeating that the real claim of his master, Hippocrates, to divinity (or sainthood) rested on his reverence for, and obedience to, Nature (*Physis*). Modern Western civilization, by its scorn for and defiance of man's essential nature, threatens without a doubt to gravitate downwards into anarchy.

Meanwhile in the sphere of medicine is it not clear that unofficial quackery is going to raise its head *pari passu* with official regimentation?—I am, etc.,

North Queensferry, Fife.

A. J. BROCK.

Medical History of Individuals

SIR.—In view of the talk of a comprehensive medical service there is one reform which is immediately applicable, urgent, and which would, unlike most medical reforms, be universally welcome. At present in the Army, I understand, there is a wonderful system whereby a man's whole medical history from the time of his medical board onwards is recorded and readily available for use by his M.O. Consider the chaos in civilian life. When a child leaves school and comes on the panel his panel doctor can only get his school medical record by writing for it. The medical board for examining a recruit does not see his panel medical record. When he is discharged from the Army again his panel doctor can only get his Army medical history by writing for it and enclosing the written permission of the patient. The man may then have to be examined by the Home Guard medical officer, by some doctor to see whether he is fit for fire-guard duties, etc., and in no case can the doctor obtain his whole medical history; each doctor has to examine him afresh.

The silly part is that the Government already has the answer to many of the questions which it poses to the examining doctor, but filed away in another Department. Thus the factory doctor is supposed to examine a new worker thoroughly and record the result, even though the Army medical board which has just discharged him or the medical authority of the school he has just left has the complete answer. Why cannot each panel patient, at any rate, have in his medical record a complete account of his condition every time he is examined on behalf of the Government? And why cannot that system be extended to the rest of the nation?

Finally, may I put in a plea for better medical records on the panel. Most of them are terrible. Usually only the medicines given are recorded. Sometimes the doctor keeps a list of the diagnoses; sometimes one can see from the record that organs were removed in the patient's last visit to hospital. Seldom are the physical signs recorded; yet these are of vital importance later, and of great assistance to the at the time, in arriving at a diagnosis.—I am, etc.,

Colchester.

M. E. LAMPARD.

Tuberculosis in Nurses

SIR.—In a leading article in the issue of Dec. 4 you regret that England has done nothing towards the investigation of the problem of tuberculosis in nurses. For once this country has not been quite so inert and remiss as usual. The Royal College of Physicians has for the past nine years been conducting just such a research, on a large scale and over a ten-year period, with the aid of the Prophit Trust. A preliminary report on the work has been published by Dr. F. Ridehalgh in the *Lancet* (Oct. 17, 1942, p. 463); a final report on tuberculosis in nurses will, it is hoped, be published shortly.—We are, etc.,

CHARLES NEWMAN,
Chairman, Prophit Survey Comm.,

Pneumonitis

SIR.—Dr. Maxwell raises an important point in his letter of Nov. 27 (p. 689). Although the New Sydenham Society's *Lexicon* of 1899 uses the word "pneumonitis" as synonymous with "pneumonia," we must agree with him that the latter term has by long custom come to denote a specific disease "running a definite clinical course, with a high mortality if left untreated and terminating by crisis." He might have added also that it is accompanied by a perfect series of demonstrable reactionary manifestations in the blood, typical of a specific bacterial infection. It is true that even prior to the advent of sulphonamide treatment the classical pneumonia, like many other diseases, was changing in type and was occurring in decreasing incidence whilst crises seldom presented. With the modern use or abuse of these drugs the picture may never be seen.

When the influenza epidemic, with its usual periodicity, recurred in 1918 a new picture—new to our generation—presented itself. The lungs were obviously affected, but physical signs of consolidation were obscured by the associated acute emphysema, although later x rays were found to demonstrate areas of infiltration. There was much toxæmia, no leucocytosis—on the contrary, often a leucopenia with monocytic activity, characteristic of virus infections in general—and at times a slow pulse. Anatomically the entire lung tissue was involved, and I have described elsewhere the degeneration and striking friability of the whole lung in fatal cases. In 1918 I used the term *pneumonitis* to denote the generalized inflammation of the lungs, although later I felt that the changes were degenerative and of toxæmic origin rather than inflammatory. Later I included the more chronic changes, which at times accompanied delayed resolution, these often prolonged and even simulating tuberculosis, for which they were mistaken in x-ray films.

If the term *pneumonitis* be accepted, it does not, as Dr. Maxwell says, signify anything more than an inflammation of the lungs, and should suffice until a more significant name based on a sound aetiology be coined. Furthermore, by not confounding it with pneumonia, which by now has come to denote a well-defined infective disease, our aetiological excursions will not be obscured. Instance the persistent attempts during the pandemic, and later, to bolster up Pfeiffer's bacillus as the causal factor. Whether the primary atypical pneumonia recently described is of this nature I must not opine. That it is a new disease is as unlikely as that any disease is new. Hamer² pointed out that one of the striking characteristics of influenza is its power of impressing the mind of observers as being a "new disease." It is significant that at the same time as we are hearing of this disease we are experiencing an increasing incidence of "virus" diseases—herpes zoster, infective jaundice, glandular fever, poliomyelitis and polyneuritis, and, latterly, influenza. Hence let us not dwell too long on an unusual diseased state lest we lose perspective, but rather ask ourselves whether we are working up to a new epidemic, remembering that influenza recurs in epidemic form about every 25 years. And, again, I recollect that in 1918³ I described an epidemic of "glandular fever" which merged into the influenza pandemic, and which I still feel was part and parcel of the same state, the virus having gradually exalted itself.

However, my attempts at nomenclature were not favourably received. Hence Dr. Maxwell's letter brings some satisfaction, even at this late date. Nor would I claim any originality for the use of the term. In the Westminster Hospital Museum Catalogue for 1905 and later years I find I have described specimens under the name of *pneumonitis*, although these were not exactly what I had in mind later. I have no doubt that I gathered in the word from my senior colleague Dr. R. G. Hebb—that redoubtable and learned physician-pathologist. Finally, if the condition which has aroused this correspondence be of benign nature, perhaps the name "pneumonicula," described in the Sydenham *Lexicon* as a slight pneumonia, might be suggested to those who find it difficult to depart from traditional usage.—I am, etc.,

Omens of Influenza.

SIR.—In your leading article of Dec. 4 (p. 717) on the outbreak of influenza, in which you ask if "there are any omens by which we could predict a widespread outbreak," you comment on the apparent conflict between your information that virus A has been isolated and the statement by the Ministry of Health that "the illness from which most of the victims are suffering is not the real 'flu virus.'" This apparent difference might, I think, be explained in terms of time. It would be interesting to know if the Ministry has carried out, or means to carry out, further investigations in the same area to see if the virus A can be recovered in a later phase of the epidemic.

The simplest way of correlating these conflicting observations appears to be to regard influenza as a potential complication of any epidemic of common colds; not so much a complication of the individual who suffers from a cold, but as a social complication, for it is rarely the agents who activate this vast phenomenon who are themselves the greatest sufferers. This may be the reason why there is an apparent lag of a few weeks from the start of the wave of colds to the appearance of the influenzal wave.

Unfortunately I do not know how to express this more clearly, nor can I offer any explanation which is not highly speculative, but I published a chart illustrating this feature of the 1940 epidemic (*Journal*, May 25, 1940, p. 869). Recently a friend, who had studied my chart on that occasion, asked me if the epidemic had taken me by surprise, and I invited him to come to my surgery and he would see the answer for himself. The chart is open for inspection. There are omens of influenza, but it is impossible to imagine how they could ever be seen by anyone who tries to look for them through a fog of viruses.—I am, etc.,

Halifax.

A. GARVIE.

The Element of Fatigue in Disease To-day

SIR.—I am grateful to Dr. T. L. Hardy (Dec. 4, p. 725) for bringing out this factor in regard to peptic ulcer cases. It is showing itself at present in a number of asthmatics (and three angioneurotic oedema patients), who would otherwise have been able to "carry on," and would, therefore, never have come under my notice. One, a young woman of 23, a stockbroker's clerk by day, felt impelled to do her bit by night as an officer in the voluntary A.T.C. Another, a confectioner, short-staffed and compelled to work hard in both her bakery and her shop, added to all this amateur acting at night. A third, an accountant, only had an asthmatic paroxysm in the night after he had mown the lawn in the evening. One knows, of course, that tiredness increases an allergic tendency, and that a dish—e.g., some *réchauffé*—which will produce no ill effects if taken at lunch-time will, taken at supper by the same person, be followed by a thoroughly restless night.

In the next letter in the same issue Sir Arthur Hurst also reminds us of the frequent association of "acidity" with achlorhydria. This complaint is often met with in asthmatics, and routine gastric analyses of them often show achlorhydria or hypochlorhydria.—I am, etc.,

Manchester.

F. E. TYLCOATE.

Gunshot Wound of Innominate Artery

SIR.—Mr. G. F. Langley (Dec. 4, p. 711) records a case of gunshot wound of the innominate artery. He explains the hemiplegia which resulted on the hypothesis of cerebral anaemia due to spasm of the common carotid artery, which was observed at operation. This, however, was not checked by post-mortem examination.

In four cases of gunshot wounds of the carotid arteries, followed by hemiplegia and a fatal result in 26, 18, 15, and 72 hours after receipt of the injury, a post-mortem examination was made by Prof. John Shaw Dunn (*Lancet*, Jan. 13, 1917, p. 57). In each case an embolus had blocked either the trunk of the middle cerebral artery or its branches, with several inches of intact vessel between this point and the site of injury. In one case only was the common carotid tied on account of continuing haemorrhage from the wound. In one other the carotid trunk was found completely severed.

The progress of the paralysis beginning with a monoplegia in the case so carefully observed by Mr. Langley suggests that the pathological process may have been the same. If so the gallant attempt of Mr. Langley to save his patient was doomed to failure from its inception. The specimens have presumably been destroyed in the wreck of the Museum of the Royal College of Surgeons, but two of them are illustrated in the paper by drawings by Mr. A. K. Maxwell.—I am, etc.,

London, W.1.

LIONEL COLLEGE.

March Fracture of the Metatarsals

SIR.—All who have fresh evidence about obscure conditions should publish the facts. It is more important that what is written should be strictly accurate as to facts and up-to-date as to information and views published by others. In both respects Fl. Lieut. Barns's article on march fracture of the metatarsals (Nov. 13, p. 608) leaves much to be desired. This letter is intended to correct some mistakes and misconceptions which appear to have arisen.

No discussion of the aetiology and diagnosis of march fracture can be complete if it ignores authoritative works on the structure of the foot. As in the case of so many other "minor" abnormalities of the foot, a proper conception of the structure and nature of the foot is essential to a correct appreciation of observed facts. In his reading Barns appears to have overlooked the foot in his concern with the metatarsal. Yet even in the limited field of march fractures he has omitted several very excellent papers. Those of H. Dodd (1933) and J. Blair Hartley (1943), for instance, are of the utmost importance. It is not surprising, therefore, to find him stating: "No obvious foot deformity was observed." "The aetiology of the lesion is obscure." "The injuries were sustained . . ." (*My italics*.)

The essence of the diagnosis of march fracture is that there has been no "injury." In civilian life it is all too clear that the onset is spontaneous. In the Forces it is equally clear that the only trauma is that of repeated physiological strain and stress. In both groups the problem is not so much why march fractures arise as why they do not occur more frequently. Barns states that in one of the twenty cases the cause was a single direct trauma. In fourteen others there is the possibility of a single direct or indirect trauma. In only five of them the fracture "could not be ascribed to any particular exercise." It is therefore necessary to ask whether any of them are true march fractures—i.e., spontaneous stress fractures. We know that in civilian life it does not require the slightest change of habit to produce them. They occur quite spontaneously, though not without explanation.

As I wrote the last sentence an acquaintance, a woman civilian aged 43, asked me if it was any good rubbing an aching foot. She then told me the following story. Three days previously she had woken up with an ache across the dorsum of the foot. She rubbed it. As she walked about during the day she felt as if her toes were being forcibly dorsiflexed. A little pain developed. Her foot swelled over the top of her shoe. The pain was worst if she stood up on her toes. She limped a little, but was not otherwise incommoded. The swelling had now gone, but the ache persisted intermittently. I told her of Barns's article, read out to her the identical symptoms which he records, and told her of the sentence I had just written. An examination of her foot revealed the other well-known points—namely, tenderness restricted to the dorsal aspect of one (the second) metatarsal, no swelling, no bruising, and the expected deformity of the foot.

In her case the deformity was obvious. (It was confirmed next day by x rays, which were otherwise "normal.") There was an everted heel, a pronated foot with bulging scaphoid, and "low arch"; there was also some hallux valgus and spread metatarsal. The essential deformity (for march fractures of the second metatarsal) was the elevated first metatarsal. When she stood with the heel upright the first metatarsal head left the floor and the hallux plantar-flexed. It has been shown by D. J. Morton, and confirmed in Britain, that each metatarsal transmits a share of the weight borne by the forefoot. It is normally two units for the first and one unit for each of the other four metatarsals. Morton (1935) showed that the first metatarsal (and the internal cuneiform) may be hypermobile. Lambrinudi (1937) has described cases of permanently elevated

first metatarsal. First metatarsals so short that they do not take their share of the weight are described. Whichever the cause, there is failure of support at the front and inner side of the foot, and the foot rolls over into pronation. When this happens a change may occur in the second metatarsal. If it is elevated or hypermobile nothing happens to it. When it is firmly fixed it either hypertrophies (Morton's and Kohler's stout second metatarsal), undergoes the change known as Kohler II, or is affected by march fracture—i.e., stress fracture. The deformities are present for all to see, but they may be very slight. As I have pointed out on other occasions, the foot is a very small object, made up of small and even minute structures, and when we examine for abnormalities we must look for small deviations from the normal. It is failure to appreciate that fact which leads to the statements that there was "no obvious foot deformity" and that "the aetiology is obscure."

The explanation of march fracture affecting other than the second metatarsals—and I have seen one even of the fifth—is failure of the supporting action of adjacent metatarsals so that undue stress is thrown on the one which fractures. I have seen the third fracture after removal of the head of the second. I have seen the second fracture, become united, and then the third metatarsal give way. It should, perhaps, be explained that another reason for overlooking what many of us now regard as very evident is a misconception of the nature of the foot. It is not yet widely accepted in Great Britain that the shape of the foot, as well as its lateral balance, depends on the shape of the bones and the strength of the ligaments. Despite the experimental evidence of D. J. Morton and Norman Lake and the clinical evidence of Jack and of Lambrinudi—all of which I have been able to confirm without reserve—many British surgeons persist in the view that the muscles are the main support of the dome of the foot. The view arose as a result of the work of Sherrington on contractural and postural tonus, and is the result of misapplication of his findings. So far as the shape and balance of the foot are concerned, the part played by the muscles is to balance the foot on the leg at the universal joint and to lock the bones into a firm dome under certain circumstances. But they play second fiddle to the ligaments. I demonstrate these points very fully in my film "Some Foot Faults related to Form and Function." There is no room to amplify them here. The principle to grasp is that a structural defect of the foot frequently leads to other, and therefore secondary, defects.

The last important point to make about march fractures of the metatarsals is that it is impossible to diagnose them with certainty by x rays if one pays attention only to the fractured metatarsals. The various points about hypermobility, elevated or short metatarsals must be taken into account. Even then one can say only that it is *probably*, or is *unlikely* to be, a march fracture. I have a series of x-rays of march and ordinary traumatic fractures of metatarsals which exhibit a very wide diversity of serial x-ray changes. There is no series of changes which characterizes or distinguishes one from the other. In some cases a fracture due to a single direct trauma undergoes the changes that we have in the past accepted as characteristic of march fractures. In others a march fracture shows those said to be characteristic of the single direct traumatic type. In some the fracture may be visible before periosteal reaction," while in others the subperiosteal new shows before the absorption and osteoporosis at the fractured site demonstrate the loss of continuity of the bone. The final result may be a complete return to the normal architecture or the presence of a spindle of bone. It depends on whether displacement of the two fragments takes place. Treatment makes no difference. My practice is to apply elastoplast strapping to either type, using novocain infiltration to abolish pain if it is severe. But when most of the pain is due to contusion of the soft tissues over a wide area it is often wise to rest the foot in a walking plaster for a short period.

In short, people suffer from march fractures because the structure—the architecture—of their feet is wrong, and not because of any unusual external factor. The only part that external factors play is the same as applies to any mechanical structure. A bridge designed to carry 5 tons is more likely to give way when 10 tons go over it than one strong enough to support 10 tons.

I have made this letter long and strong because we have reached a stage in the knowledge of the behaviour of the foot when we can no longer be content to impede the diffusion of knowledge by accepting without protest articles which ignore facts accumulated by other workers.—I am, etc.,

Manchester.

Peptic Ulcer in Youth

SIR,—In the correspondence columns of your issue for Oct. 23 (p. 523) Mr. Blacow Yates referred to a case in which gastro-enterostomy was carried out for pyloric stenosis in a youth of 19 years, and threw out the suggestion that I might be aware of the performance of this operation at an earlier age. I well remember the days when gastro-enterostomy was done for congenital hypertrophic stenosis of the pylorus in infants, but with only very occasional success.

Recently, I am glad to say, there has been a revival of interest in congenital defects generally, and gastro-enterostomy has been carried out on several occasions for atresia of the duodenum. My old pupil Stewart Feggetter of Newcastle-upon-Tyne has operated on four cases, one of which he reported in detail in the *Lancet* of Aug. 17, 1940. In May of this year, when I last visited my old hospital in Newcastle, I was invited by Mr. Norman Hodgson to deal with an infant just 5 days old and the victim of atresia which had been referred for surgical treatment by Prof. Spence. In that case gastro-enterostomy was entirely satisfactory, and the infant was thriving some months later. But these cases were clearly not of the type Mr. Yates had in mind.

In March of 1925 Dr. Dunlop Lickley of Gosforth asked me to see a little girl of 4 suffering from increasing and most troublesome vomiting which had come on with pain and was attended with rapid wasting. The patient had been a perfectly normal infant, and up to three weeks before I saw her was regarded as a healthy child. There was no blood in the vomit and no history or signs of melaena. An x-ray examination showed a very much narrowed pylorus with marked stasis. There was also albuminuria. As the condition did not yield to medical treatment and the child was rapidly getting worse operation was advised. I suspected that we were dealing with a condition simulating congenital hypertrophic stenosis. At the operation I found the pyloric end of the stomach contracted, thickened, and reddened, and the lymph nodes were enlarged. The appearances were not like those of ulceration. Posterior gastro-enterostomy was carried out, but the child developed regurgitant vomiting, and on the fourth day I had to make an entero-anastomosis. After that recovery was slow but assured, although there was some recurrence of stomach symptoms two years later associated with albuminuria. Thereafter she has kept very well, and up to the present time, 18 years after operation, has had no further return of her stomach symptoms. The patient is now in good health, is married, and expecting her first baby. Thanks to the care of Dr. Lickley the original x-ray films have been preserved and were kindly sent to me. They show marked dilatation of the stomach with gross narrowing of the pylorus and some deformity which my radiological colleague, Dr. Topham, pronounces as compatible with ulcer.—I am, etc.,

British Postgraduate Medical School, W.12.

G. GREY TURNER.

Diet in Peptic Ulcer

SIR,—In view of the disastrous effect of peptic ulceration on industry as well as on personal safety and happiness it is important to stress the uselessness of trying to make much impression on it by minor tinkering with the articles of diet.

The patients concerned in this correspondence are either those working despite the presence of an active ulcer or those who have a healed ulcer. It is most important to know under which head the patient comes. As regards the former and, I fear, numerous class, they should be recumbent and under treatment at the earliest opportunity. However, many continue to work, taking only a day or two off during the bouts of pain; eventually they present a callous ulcer. With careful

and repeated gastroscopic control, I find no difference in the comfort and rate of healing between the hospitalized patient on an "ulcer regime" of frequent feeds and alkalization and the hospitalized patient taking the normal hospital diet, only three meals a day and no drugs at all. In view of this fact I do not think this class of patient will be much benefited by instructing him to follow an abnormal dietary regime which necessitates special difficulties and anxieties about food at each meal.

The second class—the patient with the healed ulcer—appears to be comfortable on a normal full diet with the extra milk usually allowed. Should such a patient complain of dyspepsia one should suspect that the ulcer is really still unhealed or has relapsed. My own practice is to retain a patient in bed until proof of healing is obtained by gastroscopy in gastric ulcer and by radiology in duodenal ulcer cases. The practice of regarding the disappearance or absence of physical signs or of symptoms as proof of the healing of ulcers cannot be too strongly condemned. Reliable physical signs of ulceration are often absent from the start, and it is common to see an active penetrating ulcer through the gastroscope several weeks after all pain and discomfort have gone.

The most serious feature of the peptic ulcer problem, however, and the one which so often makes surgery advisable, is not difficulty in making it heal, but the strong tendency to relapse, especially in the chronic ulcer, and even after good healing. Local deformity, fixation, or stenosis makes the scar site more susceptible to local traumata, and it is probable that the thin, newly regenerated mucosa, which occupies the centre of the scar, lacks the protective anti-acid-pepsin factor or lacks mucus-secreting cells. Again, I doubt if any special dietetic factors, apart from the coarsest roughage, would make much difference to the relapse rate. Many of our most conscientious patients relapse repeatedly. A varied, easily prepared diet containing adequate vitamin, especially C, as well as adequate nourishment is important in the attainment and maintenance of healing. Only gastric irritants and coarse roughage need be avoided.

Careful inquiry directed to the time preceding the first dyspepsia often elicits a history of irregular or missed meals, or a sudden change in the hours of taking the main meals. This suggests that workers and employers should be informed of the importance of getting regular meals leisurely masticated with rest before and afterwards in reasonably pleasant surroundings, and of taking breakfast before starting work. Much also could be done to enable workers to live near their place of work, which would help them to have extra time for leisure. Shift work should be regarded as bad in principle, and might be rectified by making employees either day or night workers—possibly making financial compensation to those who adopt the less popular hours. These, too, are the lines on which we must tackle the more important question of the prevention of ulcer.—I am, etc.,

NORMAN TANNER.

Scabies

SIR,—Dr. MacCormac's article (Nov. 27, p. 667) on three skin diseases in wartime deals instructively with this subject, and if those treating scabies all carry out his directions an immense improvement in the present situation will occur. Two applications of 25% benzyl benzoate emulsion, as he describes, will give uniformly good results, although authorities with really skilled treatment orderlies have obtained equal success with one application (see Graham, J. R., *Journal*, 1943, 1, 413). It is tragically common still to find people with a sulphur dermatitis on one part of the body and a live sarcoptic infection on another; to find patients who have been instructed to apply a medicament daily for an unlimited period and to boil all their bedclothes every day; and to find children deprived of months of schooling because of a disease which can be rendered non-infective in a matter of minutes and completely cleared up almost as rapidly.

With regard to disinfection of bedding and garments, I still feel that, although this can do no harm and may occasionally be useful, provided that it does not divert energies from more important measures, Dr. MacCormac's evidence of a "minor epidemic occurring among fire-watching parties through communal blankets" requires some comments. I am afraid this

phrase will be quoted and reproduced in textbooks, so that in twenty or thirty years we will be faced with the statement that such an epidemic did, in fact, take place during this war. I have been unable to find evidence of localized epidemics of scabies, either among fire-watchers or among groups of military personnel living under confined conditions. Of course one commonly sees fire-watchers with scabies, but then practically the whole adult civilian population of the country engages in fire-watching. The evidence that fire-watchers have contracted their scabies through "communal blankets" is scanty and is mainly based on unsupported statements from the patients themselves. Similarly, in the early part of the war practically every soldier with scabies attributed his infection to blankets, but it has been shown since that most of these infections came from outside civilian sources.

I would submit that, while scabies is widespread and is indeed causing a minor epidemic, there is no evidence to suggest that this epidemic has been greatly aggravated by communal blankets among fire-watchers, nor indeed that fire-watchers, as such, are particularly prone to infection. Furthermore, if a few people are probably infected through the intermediary of fomites, reinfection from this source, after benzyl benzoate treatment, is rare, due to the acaricidal medicament on the skin of the subject.—I am, etc.,

Sheffield.

KENNETH MELLANBY.

X Rays and the Clinical Society of London

SIR,—In his recent presidential address on the old Clinical Society before the Clinical Section of the Royal Society of Medicine (Nov. 20, p. 651) Dr. J. D. Rolleston said that the most interesting event in its history was the first medical description of x rays in this country, which was given by Prof. Silvanus Thompson before nearly 400 members on March 30, 1896. But I was present as a guest of the late Dr. R. T. Williamson, while I was still a school-boy, at a big meeting of the Manchester Medical Society twelve days earlier—on March 18, 1896—when I heard an address by Prof. Schuster on the "Roentgen Discovery." In the discussion which followed I remember a surgeon saying how useful the rays would be in the treatment of fractures, a physician suggesting that they might reveal the presence of an aneurysm, and an obstetric surgeon saying, amidst much laughter, that they might help him to diagnose the presence of twins.—I am, etc.,

Oxford.

ARTHUR HURST.

Surgical Tuberculosis in South Africa

SIR,—The *Journal* of Aug. 14 containing my letter has just reached me. I did not intend to imply that cases of "the typical non-pulmonary lesions of the disease in humans" are due to the bovine bacillus, but was merely drawing attention to the extreme frequency of surgical tuberculosis in this country. I agree with the rareness of these lesions being caused by the bovine bacillus. Where the bacillus could be identified in cases investigated from this hospital the causal organism has always been the human bacillus.

What has impressed me, however, is the comparative infrequency of both pulmonary and surgical tuberculosis occurring in the one individual. Patients have either pulmonary or surgical tuberculosis, rarely both. It is an admitted fact that human beings can suffer from infection by the bovine bacillus. Is it possible that some of the dairy stock in South Africa is infected with the human bacillus, and in this way accounting for the frequency of the human bacilli in human affection?—I am, etc.,

Lovedale, Cape Province.

W. C. J. COOPER.

Analgesia in Midwifery: A "Mechanical Midwife"

SIR,—Having experimented rather gloomily over many years with most of the vaunted techniques for producing analgesia in midwifery the machine described by Dr. H. Rex Marrett in your issue of May 23, 1942 (p. 643), seemed possibly the answer to a matron's prayer. I have now used it in fifty cases of domiciliary midwifery and would like to sing its praises to the skies. With one bottle, for trilete only, it is light-weight and compact. It is completely simple to operate, with no taps to turn or moving parts to go wrong; and it really produces analgesia. It can be left with the mother during the first

stage, so that she can help herself to small doses as the pains get stronger. With a minimum of supervision the nurse can increase the dose during the second stage. If full anaesthesia is needed it is simple to strap on the face-piece and have the patient just where she is wanted in a few minutes.

This machine really does take half the trouble out of midwifery, and stymies that bugbear—the impatient relative. Finally, it costs about sixpence a case, and the machine is sold by Messrs. A. Charles King, Ltd., 27, Devonshire Street. It should be christened “Martha, the Mechanical Midwife.”—I am, etc.,

Ashted, Surrey.

W. EDWARDS.

Therapeutic Fallacies

SIR.—I was discussing some therapeutic fallacies with a recently qualified practitioner who swears by ammonium chloride in bronchitis; I inquired how such a mixture (or, for that matter, any mixture) simply by passing over the epiglottis and dropping down the gullet into the stomach could exert an expectorant effect on the bronchial passages. He replied, rather adroitly, that the ammonium chloride is excreted into the respiratory tract, where it acts as an antiseptic and stimulant! Do Drs. Linnell and Thomson accept this pharmacology?

It is surprising that enemata should find a place in the treatment of chronic constipation other than for the well-marked case of faecal impaction. The writers, however, having advocated this method, should make it more widely known that the way to give an enema is not with the old-fashioned enema syringe; this is dangerous and may do injury to the anal canal; the only way to give an enema is with a suitable rubber catheter linked by rubber tubing to a funnel. It should be administered only by a trained person.

Have the writers tried giving the synthetic vitamin B₁₂—that is, aneurine hydrochloride—for constipation? It is usually obtained in tablets of 3 mg.; 4 to 6 of these should be taken daily in moderate cases and 8 to 10 in obstinate ones. I have known this treatment give quite good results.—I am, etc.,

Salford.

JOSEPH FARNES.

Agents Provocateurs

SIR.—I was interested indeed to see your annotation on the police decoy case and Mr. Reginald Payne's letter on the same subject. This extraordinary incident has a direct bearing on an article of mine, “A Problem in Medical Certification, etc.,” which you published in June of last year.

In that article I mentioned the importance of the patient's statement, and I emphasized that not only should the doctor accept any reasonable statement which the patient gives of his symptoms, but that, in fact, he is *obliged* by his professional code to do so. By a reasonable statement is meant a statement which cannot be definitely disproved by a fair and careful clinical examination. His conscience and his honour tell him that his first and prime duty is to his patient, and the law clearly and emphatically tells him that he must not do or omit to do anything that would cause him to fail his patient in any way in which a careful and skilful doctor would not so fail that patient. He is expected to bring to bear upon his cases “a reasonable degree of care and skill,” and if he fails to do this in any case the civil law always, and the criminal law sometimes, can penalize him very severely. This does not mean, of course, that he is to accept any absurd statement a patient makes to him, but that he must give credence to any statement which, in the light of his knowledge and experience, *could reasonably be true*. He may know that the patient might be exaggerating, as many genuine sufferers do, and he might even be aware that the patient might even be lying; but I maintain that if he is faced with two reasonable alternatives he must always and deliberately accept the one in favour of the patient.

Almost any example from actual experience will convince one of this. Epilepsy cannot be diagnosed in the surgery by any known method of examination, and many practitioners are to-day successfully treating epileptics without having seen them in a fit and purely on the description of the fits given at second-hand by the patient or his relatives, as only the fortunate few have access, even indirectly, to the evidence furnished by an electrocephalogram. The doctor who refuses to certify such a person as being unfit to follow an occupation

which could be dangerous to the applicant would certainly be unable to justify himself to the coroner if his patient fell off a steeple or mangled himself in a machine, and legs he could have little hope of rebutting a charge of culpable negligence. In the eyes of his colleagues, and surely before his own conscience as well, he would be little less than a pliant murderer.

The thing is so obvious that one feels impelled to apologize for pointing it out, but it is far from being realized even by many doctors! It would be fairly easy, therefore, for a rascally conspirators who were really competent at their shabby job to bring a very telling case against almost any doctor on a question of certification.

This is a most disquieting case altogether, and exemplifies too well the dangerous tendency which is being exhibited in certain bureaucratically minded people to interfere in the liberties so dearly bought for us by de Montfort, Wycliffe, Hampden, and the rest. I am wondering what is going to happen to me and to my colleagues when and if we are put under any central control, however benevolent it may be. Torquemada, as he carefully explained, was a most benevolent fellow.—I am, etc.,

Sunderland.

A. KEFALIS.

Hospital Diets

SIR.—A short letter of mine in answer to the question raised in your columns apparently received notice in the daily press with the result that I have received what I believe is call in film circles a “fan mail.”

One letter was signed by all the patients in a ward at a certain hospital describing a menu which had not varied for four and a half months, and asking—very pertinently, I think—“What becomes of our bacon, butter, lard, eggs, and sweets?” Another describes a petition signed by inmates of the male and female wards of a sanatorium asking for more or better food, and the stopping of all ward entertainments as a punitive measure by the medical superintendent in consequence. Then I may say, was in England and not in Germany! There one complaining that herrings are cooked and served “complete with heads, guts, and scales”; and describing an epidemic of diarrhoea among patients and nurses, who had the same food. There have been other complaints that “points” coupons are removed for a greater period than the patient's stay in hospital.

Apart from the question of adequacy, there would appear to be a need for closer administrative control to ensure better cooking and the supply to patients of rations to the full value of coupons removed from their ration books. I am surprised that any hospital should require the handing over of its personal “points” for the supply of sweets, as they cannot possibly be regarded as a legitimate part of the ration.—I am, etc.,

Brookwood, Surrey.

H. M. STANLEY TURNER.

Contraception and Sterility

SIR.—Mr. Green-Armytage implies to your readers that his colleagues whose textbooks he quotes (Nov. 27, p. 691) are in agreement with his views on contraception and sterility. Yet actually these references are most moderate, and allude exclusively to the use of chemical methods, no mention being made of the other hydra-headed dangers which Mr. Green-Armytage senses in the practice of contraception. The chemical methods criticized are mainly of the “quinine” variety, which are, of course, not medically recommended; but even then the gravity of the charges seems to be limited to theoretical possibility. The following quotations include the whole relevant context.

J. H. Peel (Forsdike), p. 341: “It is claimed by some that the constant use of chemical contraceptives predisposes to subsequent sterility—without, however, very much positive evidence to support this claim.”

Blair Bell, p. 336: “It is possible that the use of chemicals for contraception practised during a long period of time may lead to sterility, for we have known such a combination of circumstance, but it is difficult to assert that the sterility is a sequel to contraceptive methods.”

Beckwith Whitehouse (Eden and Lockyer), p. 215: “Associate with the use of chemical agents is the important question of harmfulness of the preparation used. We have already referred to the irritant character of quinine and soaps upon the vaginal epithelium.”

another aspect of the same problem is whether subsequent fertility may be impaired by their use, and whether ill effects are produced upon children that result from their failure. It is not beyond the bounds of possibility that a spermatozoon may suffer trauma from a chemical spermicide, and yet be capable of fertilizing an ovum. For these reasons the employment of mechanical contraceptives appears to us to be more desirable than chemical contraceptives, apart altogether from the greater reliability of the former."

One might have thought that a theory would be more discredited than upheld if this is the best corroborative evidence upon which it can be substantiated. Let us make no mistake. The control of excessive fertility has become an integral part of our present-day family life, and the medical practitioner cannot allow himself to take an ill-informed or biased view upon the subject. If there remains any serious medical concern about the bearing of contraceptive practices upon sterility, it will be essential to search for the facts in the only scientific way—viz., a statistical inquiry into the advent of pregnancy among couples who have and have not used previous contraceptive measures. This offer was made to Mr. Green-Armytage (Nov. 6, p. 587) with the opportunity of choosing the statistician. It apparently this way of seeking truth does not appeal.—*am, etc.*

London, N.W.1.

JOAN MALLESON.

* * This correspondence is now closed.—*ED., B.M.J.*

Dentistry and Medicine

SIR,—I was surprised to find a letter in the *Journal* of Dec. 4 from a man qualified in medicine and dentistry agreeing with me in his view that there is little advantage in a dual qualification. Surely dentistry should be regarded as a specialty of medicine, and the same course should be done as in the other medical or surgical specialties? Mr. Waddy's argument leads logically to a demand for the abolition of the full medical course for the majority of specialties. However, as this is the realm of the revision of medical education I do not feel competent to pursue it further, except to state that by this I do not necessarily mean the courses as at present pursued by our future specialists.

How can a dental surgeon be described as an expert anaesthetist? As to his "considerable knowledge of medicine and surgery" I have seen little evidence of it. This "considerable knowledge" is picked up during all too brief attendances at lectures and clinics, where usually little interest is taken in him by the teaching staff, who concentrate on the medical students—it being thought apparently that these are not essential subjects for the future dental surgeon.

I am inclined to agree with Mr. Waddy concerning American dentistry, but feel that many of our own dental surgeons would agree with the Americans' estimate of their own dentistry. From the little I have seen I would say that stress appears to be laid upon craftsmanship to the detriment of the surgical aspect.

Unfortunately most of the dentists' time is taken up, as Mr. Waddy states, with prosthetic work. I cannot help wondering if a more extensive course in physiology, bacteriology, and medicine might lead to an appreciation of Dr. Broderick's *Dental Medicine* with a corresponding decline in the amount of prosthetic work done.

Lastly, if Mr. Waddy sees little, if any, advantage in a dual qualification in ordinary civilian practice, I wonder how he would explain the correspondence columns in the dental journals on the vexed question of status except as a tacit admission of the inadequacy of the dental professional standing.—*I am, etc.*

Haverfordwest, Pems.

D. STEPHENS PRICHARD.

SIR,—While it is true that the dental surgeon is, and must be for many years to come, chiefly occupied with technical procedures and the acquisition of a sound judgement in their execution, it is also true that there is a province which, because it lies on the borders of medicine and dentistry, has remained something of a "no-man's land." This made possible within our memory both the over-mechanically conceived and now obsolete type of unhygienic bridgework on the one hand, and that new massacre of the innocents, the wholesale extraction of teeth, on the other. It is the concern of both medicine and dentistry that what is important to both should be the special

study of those who may know a little of both—the medically qualified dental surgeons. Indeed there is a strong case for postgraduate facilities in this sphere available to medical and dental graduates alike.

No one will deny the necessity for training dental students to a state of technical excellence, but unless a proportion of these were also educated to view the problems of dental disease from a wide scientific standpoint the future of dentistry would be black indeed. A profession which looked no further than the mechanical repair of the effects of disease would never attract students of high capability. There is certainly no prospect of dental caries becoming a rarity until the best brains available have been further applied to the problem and their conclusions translated into administrative measures. To suppose that such endeavour should not be a principal concern of dentistry is to take a very small view of that division of the healing art; a division which, opportunity provided, should offer the highest return in public benefit by prevention, and not just the meagre dividends of palliative repair and artificial substitution.—*I am, etc.*

Basingstoke.

MARTIN A. RUSHTON.

The Human Side of Medicine

SIR,—I hope that many of our Austrian colleagues will answer the quite unnecessary and entirely unjustified insult to Viennese doctors in the letter by Dr. Alan Maberly (Nov. 20, p. 661). My own slight experience of Viennese medicine under the Socialist regime gave me an altogether different impression, which has since been confirmed by working and exchanging views with many of Vienna's best doctors now working in this country.

It is clear that Dr. Maberly does not understand what is proposed for a socialized service, the duties of a doctor to-day, or the ideal relationship between doctor and patient. He may be able to perform the curious psychological process which he suggests I should try, and separate himself into a doctor and "official" and an individual. For me, as for most medical men, there is no such possible division; whether acting as an individual toward my fellow citizens, as a doctor toward my fee-paying patients, or as an "official" toward those whom I see in any official capacity, I am still, as all doctors would be in a system in which there were no longer any fees to be competed for, concerned with the life and health of the individual whom it is my privilege to assist.—*I am, etc.*

D. STARK MURRAY.

Obituary

ROBERT WHILLIS, M.B., B.Ch.CAMB., F.R.C.S.ED.

The following obituary notice of Mr. Robert Whillis, late of Kensington Terrace, Newcastle-upon-Tyne, has been written by Mr. W. Frank Wilson at the request of his colleagues:

It was with great sorrow that the many friends and colleagues of Robert Whillis learned of his death, which occurred on Nov. 20 at the age of 45, after a somewhat protracted breakdown in health from which we had fervently hoped that he would have made a complete recovery. This was not to be, however, and we are left to mourn the loss of one who was in the prime of life and whose personal charm and generous but sensitive nature won for him a deep respect and affection from all who came in contact with him, both in and out of school. Bob Whillis (as we all knew him) received his earlier education at Uppingham School, and a letter just to hand from the present head master of Uppingham, Mr. J. F. Wolfenden, states "it is clear from his record that he was a distinguished member of the school." He played in the school rugby XV in 1916 and 1917, was a praepositor and in the Modern Sixth; surely a good record to leave behind his school-days. Having decided to follow his father's profession, he entered Pembroke College, Cambridge, and graduated M.A., M.B., B.Ch. therefrom in 1925, having previously gained the diplomas of M.R.C.S., L.R.C.P. in 1923, and was admitted a Fellow of the Royal College of Surgeons of Edinburgh in 1925. Shortly after graduation he was appointed house-surgeon and, later, house-physician at University College Hospital and afterwards spent a useful period abroad in the Viennese clinics. On his return home he obtained the appointment of registrar to the ear, nose, and throat department of the Royal Victoria Infirmary, Newcastle-upon-Tyne, later being appointed

honorary assistant, and in 1940 was elected honorary surgeon in charge of this department, a post held for 20 years by his father, who had, in 1910, originated and devised the method of complete enucleation of tonsils with the guillotine—a method which has only to be mentioned in laryngological circles to arouse discussion and often a sharp division of opinion between those who can and the others who can't master and accomplish the trick of its technique.

Robert Whillis was a most capable and conscientious worker, never sparing himself and giving the best that was in him on behalf of the hospitals with which he was associated, his colleagues, and his patients. For fifteen years we worked together in almost daily contact, and no man ever had a finer partner and friend in the truest sense of what both should stand for. He played the game for the sake of the "team," which he would never let down if any effort of his could prevent it. Had he been spared to run a longer course, his work and scrupulously upright example would have shed added lustre on the specialty in which he was so deservedly successful and upon the wider plane of medical life. He leaves behind him very pleasant and abiding memories of a dear and gentle spirit. To his widow and daughter and to his father and mother, we, his colleagues, take this opportunity of expressing our deep and sincere sympathy in their bereavement.

The death of Dr. FRANCIS BARKER will be deeply regretted by the many who knew him. A member of a well-known Scottish family and allied to others which have also achieved distinction, he was a man of fine physique and high intellectual capacity. At lawn tennis he was, as a young man, in the class of tournament players and he was a good golfer. He possessed a charming singing voice and was intensely musical besides being very well read. He specialized in gynaecology and obstetrics and in that capacity was for many years on the honorary staff of the Hospital of St. John and St. Elizabeth; he was also its medical superintendent. At the outbreak of war he became superintendent of the hospital at Ashridge Park and continued to work there till his health failed. A man of strong views and forcible personality he was loyalty itself to what he held to be right and to those who, in his opinion, followed the right, and he had a kind and generous heart. He leaves a dearly loved wife and daughter, and to them the sympathy of all his friends will go out in full measure.—V. B.

Universities and Colleges

UNIVERSITY OF OXFORD

Plastic Surgery Unit

As briefly announced last week (p. 768) the Nuffield Provincial Hospitals Trust, at Lord Nuffield's suggestion, has offered the University of Oxford £8,000 a year for ten years towards the cost of establishing and maintaining a plastic surgery unit. The University has accepted the offer and has appointed Mr. T. Pomfret Kilner as the first director of the unit with the title of Nuffield Professor of Plastic Surgery. The Radcliffe Infirmary will provide hospital facilities for the unit, and these will be supplemented by the Ministry of Pensions. The total of Lord Nuffield's direct personal gifts to the University of Oxford for the purpose of the development of the Medical School now amounts to £2,810,000. The new unit will be a centre for the training of plastic surgeons, and will work in close touch with the university laboratories in which parallel investigations of the biochemical and other problems connected with the growth and repair of tissue, fundamental to plastic surgery, will be carried on. The war has brought a greatly increased demand for the services of plastic surgeons, and Lord Nuffield's proposal was chiefly influenced by a desire to provide the best possible treatment of casualties, especially those suffering from disfigurement caused by burns.

UNIVERSITY OF CAMBRIDGE

The Board of Research Studies has approved Dorothy Stuart Russell, B.A., of Girton College for the title of the degree of Doctor of Science; Dr. Russell is also an M.A. of Oxford and an M.D. of London University. Winifred Ferguson Young, M.B., B.Chir., of Girton received the title of the degree of M.D. by diploma in November.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

The Council of the College has decided to proceed without delay to make an appointment to the Chair of Human and Comparative Pathology instituted under the gift recently made to the College by Mr. W. H. Collins. To this end a Board of Advisers has been appointed consisting of six members of the Council, and the President of the Royal Society, the Secretary of the Medical Research Council, the acting Regius Professor of Physic in the University of Cambridge, and Prof. J. Shaw Dunn of Glasgow. Details of the appointment are being considered and will become available at an early date.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At the annual meeting held on Dec. 2 Dr. A. Fergus Hewa F.R.F.P.S.G., F.R.S.Ed., was elected President, and Drs. Charles McNeil, L. H. F. Thatcher, A. Ninian Bruce, D. M. Lyon, W. J. Alexander, and D. K. Henderson were elected to form the Council for the ensuing year. Dr. D. M. Lyon was nominated Vice President.

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

At a meeting of the Faculty held on Dec. 6, with the President Mr. James H. MacDonald, in the chair, the following were admitted Fellows of Faculty:

Qua Physician: J. W. Affleck, M.B., Ch.B.; *qua* Surgeon T. Fletcher, M.D., D.P.H., F. McD. Walker, M.B., Ch.B.

FACULTY OF RADIOLOGISTS

The following candidates have satisfied the Fellowship Board at the recent examination for the Fellowship of the Faculty: F. M. Abeles, M.D., D.M.R.E., W. Tennent, M.D., D.M.R.E.

The Services

Temp. Surg. Lieut. F. E. Fraser, R.N.V.R., has been mentioned in dispatches for steadfast courage and skill in a dangerous and important minesweeping operation.

The description of Surg. Cmdr. E. R. P. Williams, O.B.E., R.N. who was appointed a Commander of the Order of Orange Nassau for services to the Royal Netherlands Navy, is as now stated and not as published on Oct. 9 (p. 468).

The names of C. P. Miller, M.B., B.S., E. O. Pedersen, M.R.C.S. (deceased), and D. W. Quanttrill, M.B., Ch.B., ship surgeons appear in a list published by the *London Gazette* of those who have been commended for brave conduct when their ships encountered enemy ships, submarines, aircraft, or mines.

Surg. Cmdr. J. D. Simpson and Acting Surg. Cmdrs. H. I. Hoffman and E. H. Parkinson, R.N.V.R., have been awarded the R.N.V.R. Officer's Decoration.

Jemadar (Assistant Surg.) N. M. Nayar, I.M.D., has been mentioned in dispatches in recognition of gallant and distinguished services in the Middle East.

CASUALTIES IN THE MEDICAL SERVICES

Prisoners of War.—Capt. J. S. Hamilton-Gibbs, War Subs. Capt. C. Nairnsey, and War Subs. Capt. A. McN. Tomlinson, R.A.M.C. *Killed on Active Service.*—War Subs. Capt. J. C. Seddon, R.A.M.C.

Died.—Lieut. N. Clarey, R.A.M.C.

DEATHS IN THE SERVICES

Capt. HUMPHREY BARRON THOMSON, M.B., R.A.M.C., who had previously been reported missing, is now officially recorded as killed in action on or shortly after Dec. 14, 1941. From the meagre accounts which have tardily filtered through from the Far East it appears that the 2nd Batt. of the East Surrey Regiment, to which he had been posted as regimental medical officer, was holding part of the border between Malaya and Thailand. The regimental aid-post of the East Surreys was attacked and wiped out by the Japanese in the early days of their invasion. The sergeant of the unit escaped and reported that Capt. Thomson was killed in this assault. Humphrey Thomson was the only son of Prof. and Mrs. W. W. D. Thomson of Belfast. Born in 1916 he was educated at Elm Park and Campbell College, Belfast. He went to the Queen's University and qualified M.B., B.Ch., B.A.O. in June, 1939. After six months in the Royal Victoria Hospital as house-physician and house-surgeon he joined the R.A.M.C. Shortly afterwards he volunteered for service in the Far East. On arrival in Malaya he acted as medical officer in the Military Hospital at Singapore, and later was posted to the East Surrey Regiment as medical officer. A correspondent writes: Humphrey Thomson was full of the joy of life, and his wit and humour, his high ideals of honour, his straightforward nature, his outspoken championship of what he considered right won the regard and affection of all his contemporaries, while his innate kindness of heart and his old-world courtesy endeared him to the older generation. During his short residence in hospital he showed great promise of a happy and useful life in the profession of his choice. Humphrey Thomson would have been the last to claim any brilliance of scholarship or profound book knowledge, but in the medical profession he found an ideal niche for his practical capabilities and shrewd common sense. His success was also due to the absorbing interest he took in his patients, whom he always regarded as men and women rather than mere "cases" and examples of various diseases. Subconsciously he obeyed the maxim of the great father of medicine—Hippocrates—"To a love of his profession

the physician should add a love of humanity." The same trait was exhibited as regimental medical officer, and his work among the ranks received high praise from his brother officers in the battalion. The exact events which happened in that far-distant regimental aid-post may never be known, but it is certain that Humphrey Thomson faced death with a smile on his face and words of cheer and comfort to the wounded and dying men of his battalion.

Medical Notes in Parliament

The White Paper

Mr. ROBERT MORGAN asked the Minister of Health on Dec. 9 whether it was still intended to produce a White Paper as to the proposals for the reformation of the medical service arising out of the recommendations of the Beveridge report. Mr. WILLINK replied that the White Paper was in preparation. He must have sufficient time to study closely the many difficult issues involved. For this reason it was not yet possible for the date of publication of the paper to be fixed, but there would be no avoidable delay. No new consultations were being initiated. The questions involved were important, complex, and delicate, so he must feel he could take real and personal responsibility for the proposals he would put forward to his colleagues. He was giving fresh consideration himself to matters on which Mr. Brown had given full consideration. He hoped the White Paper would be issued quite early next year. The House would then have an opportunity of debating it.

Infant and Child Mortality in Scotland

On Nov. 30 Mr. KIRKWOOD asked the Secretary of State for Scotland if he was aware that the rate of infant mortality since the last war among the poorer classes had, according to recent medical statistics, been the highest in the civilized world, and what steps he was taking in the matter. Mr. JOHNSTON: According to the latest information available to me the Scottish figures, bad as they are, are not the highest even among the nations of Western Europe. The causes of the variations in these infant mortality figures are not always apparent, but a report on the subject by a committee under Sir John Orr's chairmanship set up at my request by the Scottish Scientific Advisory Committee in June, 1942, will shortly be published.

Mr. GALLACHER asked if Mr. Johnston would consider calling a meeting of Scottish members and representatives of the local authorities to discuss this very serious question of health. Mr. Johnston said that that was one of the considerations to which he had been giving attention, but it was obvious, when he read the Orr report, that there were many causes contributing to these alarming figures. Dr. EDITH SUMMERSKILL: Will not Mr. Johnston agree that this question is accurate so far as it relates to children under 1 month old? Mr. JOHNSTON replied that he could not say that without notice.

Mr. KIRKWOOD also asked if the Secretary of State was aware that the child death rate in Glasgow was higher than it was in Tokio, and what immediate plans he had for the rehousing and rehabilitation of the workers in the Glasgow area to save the lives of the children. Mr. JOHNSTON: Figures for 1936 relating to the cities of Glasgow and Tokio are to the effect stated. But the official statistics published by the League of Nations show that, for the five-year period 1934-8, the infant mortality rate for the whole of Japan was half as high again as for Scotland. Bad housing is not the sole cause of a high infant mortality. Regarding the immediate provision of more housing beyond that already under construction, I can add nothing to the explanation given to Mr. Kirkwood on Nov. 11 by the Prime Minister.

Mr. KIRKWOOD: In that reply the Secretary of State for Scotland does not deny the statement made in the *British Medical Journal* that the death rate among children in Glasgow is worse than in Tokio. What steps is he going to take to remove this terrible and disgraceful situation in the West of Scotland? Mr. JOHNSTON: The figures for one year are as stated in Mr. Kirkwood's question, but over five years the figures for Tokio are 50% worse than in Glasgow. The steps we are taking to deal with this matter are, first, to find out what are the deficiencies in the way of homes, housing, and so on—to find out what are the causes of it. The Orr Committee was set up for this purpose, and the report is now in hand, and I expect it will be published.

Vaccination

On Nov. 30 Mr. WILLINK informed Mr. Viant that the policy of his Department on primary vaccination of adolescents and young adults remained as communicated to sanitary authorities in 1929 and referred to in the Chief Medical Officer's annual

report of 1933, to the effect that it was not generally expedient to press for the primary vaccination of children of school age and adolescents in this country unless they had been in personal contact with a case of smallpox or directly exposed to smallpox infection.

The same day Sir JAMES GRIGG informed Mr. A. Edwards that, in the event of the failure of at least three attempts to vaccinate or revaccinate Service personnel, an entry was made in the records to the effect that such persons were in the opinion of the vaccinating officer insusceptible of successful vaccination. In the event of such persons contracting smallpox no specific instructions had been issued, but all the relevant facts concerning the case were recorded in the appropriate documents. Instructions had been issued that in all cases of unsuccessful vaccination the operation should be repeated until there had been three successive failures with calf lymph of known potency. The record of each failure was entered in the personal documents of the officer or soldier.

Sir James Grigg also told Mr. Viant that six deaths from encephalitis following vaccination or inoculation of soldiers had been reported to his Department since the outbreak of the war. Fifteen cases did not result fatally.

Emergency Medical Service

Sir E. GRAHAM-LITTLE was informed by Mr. Willink on Nov. 30 that the cost of the salaries, fees, and expenses of medical officers enrolled in the E.M.S. was at the rate of approximately £1,200,000 a year, and the number of medical officers receiving whole- or part-time salaries, which fluctuated somewhat from time to time, was about 1,550. Although the service had fortunately not been called upon to treat so many casualties as was at one time expected, it had been employed in caring for the numerous other classes of patients brought within the scope of the Emergency Hospital Scheme. Among these classes were large numbers of civilian sick transferred from town hospitals to outer hospitals having more adequate facilities for their treatment, and other civilian patients transferred from hospitals with long waiting lists. In the result the emergency scheme had greatly expanded the hospital facilities provided for the civilian population as a whole, and had made specialist medical skill available to much larger numbers of patients than ever before.

Views of Serving Officers

Sir E. GRAHAM-LITTLE asked whether the Minister of Health was aware of the successful protest made by the Federal Council of the British Medical Association against the nationalization of the medical profession in Australia on much the same lines as have been proposed for Great Britain in speeches by the ex-Minister of Health; and whether he would apply the argument put forward by the Australian Association also to this country, that it was unjust to make plans for the medical profession while many doctors serving in the Forces cannot make their views heard. Mr. WILLINK replied on Dec. 2 that he was alive to the importance of enabling doctors in the Forces to see for themselves what the Government proposals were and to discuss them and express views on them before legislation was undertaken. That was one of the objects of the forthcoming White Paper.

Nurses' Salaries Committee

Lady APSLEY asked on Dec. 2 whether the Minister of Health could make any statement about the Second Report of the Nurses' Salaries Committee and the action he proposed thereon. Miss HORSBURGH replied that Mr. Willink had received the committee's second report from Lord RUSCHLIFE. It dealt with male nurses in hospitals, with nurses employed in the public health services, with nurses engaged in domiciliary work, and with trained nurses employed in nurseries. Mr. Willink was communicating with local authorities, the British Hospitals Association, and the Queen's Institute of District Nursing commending to them the recommendations as to salaries, emoluments, and conditions of service, and informing them of the grant which was payable, as in the case of the previous report.

Other White Papers

In the House of Commons on Dec. 7 the debate on the address in reply to the King's speech was resumed. Mr. BARNES moved an amendment dealing with post-war reconstruction and regretting that the Government had not yet reached definite decisions on the action to be taken this session to deal with social security as envisaged in Sir William Beveridge's report. Sir WILLIAM JOWETT, replying to the debate, said that the Government had covered a vast field of work in examining the Beveridge report. In many cases they confirmed Beveridge's conclusions, but they did not slavishly copy them. In many cases they had reached their own conclusions which, he thought, were better. He hoped to produce the White Paper early next year.

He begged those who had talked glibly about the Government having murdered the report, or buried or mummified it, or who had said that the Government's scheme was a thing of shreds and patches, to wait for the White Paper, because what they said was simply not true.

Mr. MANDER asked if there were not to be two White Papers, one on the State Medical Service and one more general. Sir W. JOWETT: Yes, two or more. There may be one on workmen's compensation. The White Papers, he added, were coming soon. The question of a comprehensive medical service was an additional cause for a White Paper. It was a matter of intimate concern, not only to hospitals, clinics, etc., but to the ordinary man or woman in the street—the little man who had so often no one to speak for him and no organization he could approach. They could begin to find out what he wanted or was thinking by using the non-technical language of the White Paper setting out the Government's scheme, and by having a discussion in the House of Commons, which represented everybody. The Minister of Health authorized him to say that the White Paper would be available shortly.

The amendment was withdrawn.

Tuberculosis in Belgium

On Dec. 7 Mr. FOOT told Mr. Oldfield that according to his information 109,511 supplementary ration books were issued in Belgium in Feb., 1943, to persons certified to be suffering from tuberculosis. Undoubtedly there had been a serious increase in the incidence of this disease since the German occupation. He could not accept the accuracy of the statement in the question that at least one-third of the young persons in Belgium and 30% of the school children in urban areas were suffering from tuberculosis. He had nothing to add to his former statements on the question of allowing more food-stuffs to be imported into Belgium.

Replying to a further question, Mr. Foot said he did not agree that the cases he had enumerated were the very worst. Under the system now prevailing in Belgium anyone might apply to his doctor for a certificate showing that he was suffering from tuberculosis. It was open to a doctor to give it, even if the suffering was only to a slight degree.

Deaths from Hunger in Greece

Mr. OLDFIELD asked on Dec. 7 if Mr. FOOT was aware that the deaths due to hunger in Athens and Piraeus had increased to 1,800 in October. Mr. FOOT pointed out that precise figures of deaths in Athens and Piraeus during October were not yet available. In the opinion of the Swedish supervisors of the relief scheme the figure of 1,800 deaths resulting from starvation or undernourishment was certainly incorrect. It was possible, however, that the total of deaths from all causes during October was in the neighbourhood of 1,800. The scale of the relief sent to Greece was constantly under consideration, but he was not prepared to add to his previous statements on this subject. Mr. FOOT added that if the figure he had given was correct, it showed a substantially smaller number of deaths in Athens and Piraeus than in October last year, and considerably smaller than the year before.

Serving Officers' Views on White Paper

On Dec. 7 Sir JAMES GRIGG informed Major Nield that he was not aware of any approach having been made to members of the medical profession now serving in the Army to ascertain their views on the question of a State Medical Service. When the White Paper on the subject was issued he would facilitate arrangements whereby their views might be expressed. He could not say off-hand whether he would do this by Army Council Instruction or Army Order.

Help for Doctors in Civilian Practice

Replying on Dec. 9 to Sir Leonard Lyle, Mr. WILLINK said the need for supplying the Forces with the doctors which they required must in certain areas cause some inconvenience to the public, although every effort to mitigate this was made in selecting the individual doctors for recruitment. In any case arrangements were made to secure that essential medical attention would be available. The Service Ministers had always been ready to give what help they could from their medical departments. In the present epidemic they were co-operating in special arrangements under which their medical officers would give as much help as their essential Service duties permitted to general practitioners, factory doctors, and hospitals in urgent need. Medical officers of health were being asked to take the initiative in putting into operation the arrangements affecting general practitioners and factory doctors. Doctors

requiring help would apply in the first instance to the secretary of the Local Medical War Committee. The corresponding applications from hospitals would be made to the hospital officers. He understood that a suggestion for pooling medical officers of the Services had been explored by the Medical Personnel (Priority) Committee. The committee recommended that co-operation between the medical departments of the three Services, already carried out to a considerable extent, should be developed to the highest possible degree, but they felt that complete pooling would not be practicable.

University Grants Committee

On Dec. 7 Sir JOHN ANDERSON informed Mr. Harvey that he had increased to 15 the number of members of the University Grants Committee in order that their advice on the important problems that lay ahead might be based on the widest range of experience. Before the war the committee numbered 10, but had been reduced by deaths and resignations to 5 immediately before the appointment of the new members. Arrangements were being made to hold the first meeting of the new committee at an early date.

In a further reply Sir John said that the rule precluding those in the employment of universities from being members of the committee had been changed.

Medical News

The office of the British Medical Association will be closed from 4 p.m. on Friday, Dec. 24, until 9 a.m. on Tuesday, Dec. 28.

The Institute for the Scientific Treatment of Delinquency has arranged a university extension course of twelve lectures on the Freudian theory of delinquency by Mrs. Kate Friedlander, M.D. It will begin on Saturday, Jan. 8, at 2.30 p.m. at 17, Manchester Street, W.1. Fees: for the course £1; for single lectures 2s.

The first issue of the *British Journal of Industrial Medicine* is to be published in January, 1944, under the editorship of Dr. Donald Hunter. It will appear quarterly, and those wishing to take out a subscription should apply to the Secretary of the Journal Board, B.M.A. House, Tavistock Square, London, W.C.1. A year's subscription is £1 5s., or £1 for members of the B.M.A. Single copies cost 7s. 6d. All editorial communications should be sent to Dr. Hunter at the London Hospital, London, E.1.

The *British Medical Bulletin*, which is published monthly by the British Council for overseas distribution, is devoting its January, 1944, issue to a symposium on penicillin. Several of those who have taken a leading part in work on penicillin are contributing short review articles, and there will be abstracts of all the important British papers on penicillin which have been published between the years 1929 and 1943. There will also be a bibliography of relevant papers not abstracted. Although the *Bulletin* is not normally available in the United Kingdom, a small number of extra copies will be printed for any members of the medical profession resident in this country who would find this special number useful. Applications for a copy should be addressed to the British Council at 3, Hanover Street, London, W.1, and should be received not later than Wednesday, Dec. 22. A charge of 1s. per copy will be made, but no money should be sent with orders, as the number available will be limited.

Manuscripts and published articles submitted for the 1943 Charles L. Mayer prize are being received by the National Science Fund of the National Academy of Sciences, 515, Madison Avenue, New York 22, N.Y. The closing date for the receipt of contributions is Jan. 15, 1944. The award will be made for an outstanding contribution to present-day knowledge of factors affecting the growth of animal cells with particular reference to human cancer.

The High Commissioner for India is reported in the *Times* to have stated that medical supplies, including a million capsules of halibut-liver oil, are to be sent by aeroplane to combat epidemic disease in the famine districts of India. He said that thanks to the prompt and energetic action of the Viceroy the food crisis in Bengal and other parts is being tackled vigorously and food is arriving to relieve distress. The most serious need now is for medical supplies and organizations for after-care of the people who have undergone so much suffering. The situation is gradually improving.

The name of Dr. R. P. Brittain, ship surgeon, appears in a list published by the *London Gazette* of those who have been commended for brave conduct when their ships encountered enemy ships, submarines, aircraft, or mines.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In England and Wales the number of deaths attributed to influenza rose from 106 to 375 in the great towns; notifications of pneumonia rose by 669. (For the week ending Dec. 4 influenza deaths numbered 709 and notifications of acute pneumonia 2,291.) Scarlet fever was up by 59, and diphtheria by 27; and whooping-cough was down by 66, measles by 38, and dysentery by 29 cases.

The rise in the influenza deaths was general throughout the country but most noticeable in the northern towns. The cities with the largest number of deaths were: Manchester 44, London 29, Birmingham 20, Bristol 18, Bradford 17.

The notifications of pneumonia have been more than doubled during the past fortnight, and the total was the largest for any week since the early spring of 1941. The increase in pneumonia followed a similar distribution to that of influenza—a general rise but more marked in the north. The largest rises during the week were in Lancashire, 143 more cases, Yorks West Riding 86, London 48, and Durham 46 more.

In only a few counties was there any wide variation in the trends of the infectious diseases of childhood. There were 45 more cases of scarlet fever in Middlesex and 35 more in Yorks West Riding. There was an increase of 13 in the notifications of diphtheria in the Port Health Districts. The largest decline in measles was in Cambridgeshire by 28, and whooping-cough in Lancashire by 60; the latter disease tended to be more prevalent in the south.

Notifications of dysentery remained steady at 147. The chief centres of infection were London 26, Middlesex 21, and Lancashire 19, these three areas contributing almost half of the total cases.

In Scotland there were rises in the notifications of scarlet fever by 46, acute primary pneumonia by 28, measles by 17, diphtheria by 13; the incidence of dysentery fell by 15 and that of whooping-cough by 8. The rise in scarlet fever was confined to the western area. Of the 65 cases of measles 52 were notified in Glasgow.

In Eire the incidence of diphtheria fell by 43. The increase in infantile enteritis and diarrhoea was due to the experience of Dublin C.B., where 61 of the 70 cases were recorded.

Public Health in Eire, 1941

The annual report of the Department of Local Government and Public Health shows that the decline in the incidence of infectious diseases was continued in 1941. The statistics for the principal notifiable infectious diseases are:

Disease	No. of Notifications		No. of Deaths	
	1941	Average of 1936-40	1941	Average of 1936-40
Typhus fever ..	25	8	6	2
Typhoid fever ..	284	318	38	52
Diphtheria ..	1,447	2,410	165	275
Scarlet fever ..	2,318	3,816	32	92
Puerperal infection ..	99	104	27	54
Total ..	4,173	6,656	268	475

The 268 deaths were the lowest ever recorded for these diseases. The incidence of tuberculosis, which had been rising slightly since 1938, showed another small increase. There were 2,882 deaths from pulmonary tuberculosis—25 fewer than in 1940; but non-pulmonary tuberculosis, with 829 deaths, was 51 in excess of 1940. The increase was due to the unfavourable experience of the rural districts; 2,188 deaths from all forms of tuberculosis were registered in these areas in 1941, compared with 2,094 in 1940. In the urban areas an improvement was recorded, the deaths falling from 1,591 in 1940 to 1,523 in 1941.

The Week Ending December 4

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 2,694, whooping-cough 1,757, diphtheria 610, measles 451, acute pneumonia 2,291, cerebrospinal fever 60, dysentery 144, paratyphoid 2, typhoid 8. Deaths from influenza in the 126 great towns numbered 709—an increase of 354.

Radiotherapy for cancer cases is to be provided at Mount Vernon Hospital, Northwood, and Warren Road Hospital, Guildford (Ministry of Health Circular 2878). The former is already receiving patients from Sectors II, III, IV, and V, while the latter is ready to receive patients from the remaining Sectors. Applications, which should be made through the Sector Hospital Officer on form E.M.S. 116, should be accompanied by adequate case records (for which a special form, E.M.S. 221, is available) and any pathological and x-ray reports, with slides and films if possible.

No. 47

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Nov. 27.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included), (b) London (administrative county), (c) Scotland, (d) Eire, (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London), (b) London (administrative county), (c) The 16 principal towns in Scotland, (d) The 13 principal towns in Eire, (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1943					1942 (Corresponding Week)

ANY QUESTIONS?

Cold Extremities

Q.—For the last two years I (60 years old) have suffered from coldness of the ears and hands. The sensitiveness to cold is very marked and results in chilblains either on the fingers from resting them on cold desks and chairs, or on the ears from what I take to be the draught from driving in a motor car. The ears become so cold that they ulcerate on the upper part of the pinna and I am forced to cover them in some way. Probably there is some deficiency, but I cannot trace it to any vitamin or endocrine gland of the time. At times there is a sensation of tingling in them which is most marked. Can it be a gouty tendency?

A.—The onset after age 60 of chilblains of the extremities and ulceration of the ears on exposure to cold is suggestive of arteriosclerosis. The urine should be examined for sugar and the blood for the Wassermann reaction. If the condition is due to sclerosis of the peripheral vessels no curative treatment is likely to be effective, and reliance should be placed on protection from cold, as by gloves, Balaclava helmet, car heater, etc. Operations on the sympathetic nerve supply are probably not indicated at this time of life, but a small dose of thyroid, gr. 1/2 t.d.s., might inhibit the undue reaction to cold. Nicotinic acid may also be of value; as little as 10 to 50 mg. daily by mouth may be effective, but the dose should be worked up, if necessary, to 500 mg. a day until relief is obtained or the effects become unpleasant. No other vitamin or endocrine therapy seems promising, and the symptoms are not suggestive of gout.

Progesterone for Menorrhagia

Q.—At what stage of the menstrual cycle should corpus luteum (tablets) be administered to check climacteric menorrhagia in a nullipara? In what dosage?

A.—Corpus luteum hormone is inactive when administered by mouth, and corpus luteum tablets, therefore, even if they contain progesterone, do not affect menstrual function. If progesterone is given for menorrhagia, it should be given by daily intramuscular injections of 5 mg. for three or four days before the expected onset of the period, and for the first one or two days of the period. If the bleeding is not cyclical but occurs irregularly and persists for long periods of time, withhold treatment until the bleeding is in progress, and then give it daily for seven days. As an alternative, and if oral therapy is required, ethisterone 10 mg. t.d.s. may be employed. This substance is active by mouth, and, although chemically different from progesterone, has a similar, if less potent, action on the uterus.

Alkalosis

Q.—What exactly is alkalosis? Under what conditions does it occur? How is it recognized? And what is the treatment?

A.—A state of alkalosis exists when some change has occurred in the blood chemistry which, if uncompensated, would tend to make the blood alkaline. Thus it may be produced by an excessive loss of acid from the body or an increase in the bicarbonate of the blood above the normal level. The term is an unfortunate one because it suggests that there has been a rise in the pH of the blood, whereas in fact a very small deviation from the normal is sufficient to cause death. This compensation is effected by the buffer systems of the body, which enable acids and alkalis to enter the circulation without bringing about a change in pH unless an overwhelming amount is present.

Alkalosis occurs in high intestinal obstruction, the severe and protracted vomiting leading to excessive loss of chlorides from the body with a resulting rise in the bicarbonates of the blood. Alkalosis also occurs from alkaline therapy in peptic ulcer should the renal excretion of bicarbonate fail to keep pace with the rate of administration of alkali by mouth. The incidence is as high as 20-30% of cases on doses of 60 to 160 grammes daily of alkali expressed as sodium bicarbonate, but falls to 2-3% on doses of 20 to 30 grammes

daily. Overbreathing in mountain sickness, post-encephalitic states, and some cases of hysteria washes out carbon dioxide from the blood and leads to alkalosis by decreasing the quantity of carbon dioxide relative to the blood bicarbonate.

Alkalosis is recognized clinically by drowsiness, headache, signs of severe dehydration, anorexia, furred tongue, nausea, excessive dryness of the mouth, numbness and tingling of extremities, tenderness of the muscles, stiffness in the limbs, and slow breathing. Tetany may supervene. The bicarbonate content of the plasma is usually raised, but this is not the case in alkalosis from overbreathing. The blood urea is usually elevated and the urinary ammonia diminished. Paradoxically enough the urine is not necessarily alkaline.

Treatment is first to remove the cause. Hyperventilation can often be checked by sedatives or by inhalation of an atmosphere containing 5% CO₂. Alkalis should be stopped in peptic ulcer and feeds be salted generously. In severe cases large quantities of normal saline may need to be given intravenously. An injection of 10 c.cm. of a 20% solution of calcium gluconate will relieve tetany. Treatment by acidifying agents such as ammonium chloride is not admissible, as they increase the dehydration and the patient may quickly suddenly swing from alkalosis to acidosis.

Paroxysmal Auricular Fibrillation

Q.—A woman aged 75, with good family and personal history has had symptoms of heart trouble for 8 or 10 years. It appears to be auricular fibrillation, the attacks coming on at intervals, so long. A presystolic murmur was once heard. In the past years general failure of health and activities noticed. The last attack seemed serious, but passed off. Two days' rest with digoxin (2 tab. daily, 25 mg.) has brought her back nearly to her usual condition. Has coramine or strychnine any place in the treatment of this case?

A.—It would seem desirable to have electrocardiographic record of the heart both during and between the attacks to be certain of the nature of the disturbance of rhythm. If the attacks are paroxysms of auricular fibrillation and last only one to two days, it is possible that small doses of digoxin will do more harm than good. Digitalis preparations are usually advisable only if the attacks are of longer duration and threaten to produce cardiac muscle failure. They should then be used in full dosage—i.e., digitalis pulverulenta gr. 1½ 4-hourly for three days, and then less frequently according to the effect produced. Quinidine might be more helpful early in the attacks, 4 gr. every two hours until the attack vanishes. As a rule only two or three doses should be necessary for this purpose, and it would probably be undesirable to exceed a daily dosage of 20 gr. at this age. Rest and sedatives, such as phenobarbitone gr. 1/2 t.d.s., would seem more appropriate than stimulants such as strychnine. Coramine (nikethamide B.P.) is a medullary stimulant; it is used particularly in respiratory failure—e.g., after anaesthetics—and it has no place in the treatment of paroxysmal fibrillation. Oxygen by a comfortable mask such as the B.L.B. would also be of value in the attacks. As they occur at relatively infrequent intervals, prophylactic treatment with quinidine is probably not called for, but regular administration of a small dose of phenobarbitone might be of value.

Calcium for an Infant

Q.—What are the daily calcium requirements of a child aged 16 months, of average weight and in good condition? Milk, and anything made with it, is disliked, and the daily intake is only 2.6 oz. Until 1 year old the child sometimes took as much as 3½ pint a day, and had a bigger appetite than at present. Powdered calcium, gr. 7½, with vitamin D, was often taken daily in food, but lately such meals have been refused, apparently because the calcium renders the food unpalatable. Rose-hip syrup and cod-liver-oil emulsion are readily taken. Eggs are available, and the child likes them. Only small meals are eaten—e.g., one egg, one dessertspoon of cooked potato, and three or four teaspoons of spinach are an average dinner. First teeth were cut at 5 months; the child had 8 teeth at 10 months, and is now just beginning to cut the first molars.

A.—One gramme a day of calcium is the desirable intake for a child of 16 months. It would undoubtedly be difficult to get anything like this intake of calcium on the type of diet a child of this age could take unless much more than 2½ oz. of milk is drunk, as green vegetables or cheese are really the only other good sources of calcium in a mixed diet. It looks, therefore, as if artificial methods may have to be resorted to in this case. Clearly the best way would be in the form of calcium phosphate. There is a proprietary product, put up in tablets each containing 5 gr. of calcium phosphate, equivalent to 1.7 gr. of calcium. But even with the help of these it would be difficult in this case to make up a reasonably good calcium intake. There does not appear to be anything wrong with the calcium metabolism of the child so far as the dental evidence shows, but it would be well to try to get a good calcium intake now. It would be a good plan to increase the vitamin D intake, so that better utilization of calcium in the diet is ensured. Probably fish-liver oil, giving up to 800-1,000 i.u. of D per day, would help.

National household milk contains as much calcium as fresh milk. This could be used in making all kinds of milk dishes. Another tip is that children who dislike drinking milk will often readily take junkets. The analytical figures for milk are (per lb.):

	Protein g.	Calories kcal.	Calcium mg.	Vit. A i.u.	Vit. B ₁ mg.	Riboflavin mg.
Fresh milk	15	281	544	530	0.2	0.79
Whole-milk powder	116	2,168	4,060	4,870	1.37	5.76
National household milk powder	162	1,502	5,557	130	1.77	9.07

The advantages of using household milk powder are that, in addition to being a good source of calcium, it provides good protein and riboflavin.

Occupational Dermatitis

Q.—Recently I had to give evidence in court in a case of occupational dermatitis. Counsel asked me if the attack of dermatitis already contracted had rendered the workman more than usually liable to a further attack. I answered that it had done so. Later I came to the conclusion that extra susceptibility may be only temporary, on the following grounds: (a) By analogy: As a student I contracted severe dermatitis of hands and fingers through contact with antiseptics. For many years I have had no dermatitis, although my hands are often in contact with antiseptics. In drug eruptions (iodides, etc.) desensitization can be obtained by appropriate doses of the drug. In allergic manifestations desensitization may be obtained by calculated doses of the protein or substance concerned. (b) Anatomical: The epidermis is always being shed and renewed. Surely a time must come when an entirely new epidermis has formed which has the resistance of the pre-dermatitis skin?

A.—The risk of recurrence of dermatitis varies with (a) individual susceptibility, which may be affected by (b) number of previous attacks; (c) causal irritant; (d) the severity of the attack or attacks. Certain primary skin irritants seem more liable to give risk, on resumption of contact or exposure, to a recurrence. Notable examples in this class are teak wood dust, certain chemicals—e.g., dinitrochlorobenzol and tetryl, and formaldehyde-containing materials. Each additional attack of dermatitis renders the sufferer more susceptible, not only to the primary irritant but to others in addition, and sometimes a susceptibility is developed to contact with materials which do not ordinarily cause dermatitis. Apart from individual susceptibility, the chance of recurrence varies directly with the severity and duration of the primary or subsequent attacks of dermatitis.

My comments on the questioner's views are that his experience of one severe attack of localized dermatitis after contact with a skin irritant, with no recurrence on further exposure, has fortunately also been the experience of a large number in industrial occupations. Desensitization as a means of preventing recurrence of industrial dermatitis has not in this country proved a success. The horn cells of the epidermis, together with the products of the sweat and sebaceous glands, constitute the skin's anatomical defence against dermatitis, which being an inflammatory process (thus dependent on the presence of blood vessels) can originate only in the corium below. Although there will be regeneration of the epidermal horn cells after an acute inflammatory condition, these new horn cells may be no better in resistance to skin irritants than their predecessors, and may even be less so. On the matter of regeneration there is no doubt that diet and nutrition play an important part.

Finally, I should like to emphasize the importance after an acute attack of dermatitis of a definite period for the convalescence of the skin, which should date from the apparent local recovery.

Emulsifying Agents

Q.—From time to time references are made to new ointment bases containing emulsifying agents. These are supposed to allow better contact between the active ingredients and the skin and at the same time be easier to remove. I have also read of cleansing agents to aid in the getting rid of greasy preparations applied to the skin. Little or no mention is made of these matters in textbooks on dermatology, and I should like to know what at present are the best ointment bases and cleansing agents, and whether they are recommended for routine use or only for special purposes.

A.—Nearly all ointment bases in use to-day are immiscible with water. Their reaction to exudate and to skin contours is a physically resistant one. If an emulsifying agent is present then free interchange of therapeutic content between vehicle and tissue is to be expected. Contact becomes intimate and penetration follows. The presence of emulgent enables the removal of ointment by water rather than by oils (paraffin, olive oil, etc.). A number of emulsifying agents—e.g., lanette wax, Halden's emulsifying base, triethanolamine stearate, and cetol—are available. The *British Pharmacopoeia* will, in the near future, include a high proportion of "emulsion bases." In the greater proportion of diseases of the skin such bases are preferable from both economic and cosmetic aspects. Such bases, apart from other properties, encourage free

dispersal and rapid absorption of incorporated medicament. Occasionally an emulsifying base is to be discouraged, since it may increase the detergent effect of soap and water by rendering natural skin fats more accessible thereto. Much research is now devoted towards the provision of cleansing creams which do not "degrease" but leave, after use of an acid, "oil in water" emulsion on the skin. This approximates to Nature's normal barrier—a bacteriological protective film not wisely interfered with.

Epidemic Infective Hepatitis

Q.—According to the leading article in the *JOURNAL* of Nov. 27 jaundice has become much commoner during this war, and the tendency to diagnose cases as catarrhal jaundice is diminishing. If the prevalent variety is infective, what steps should a practitioner take to prevent the spread of infection, if there is indeed any risk of this? For example, at what stage of the disease is the patient infectious, how long does this last, and how is infection conveyed from one person to another?

A.—It is true there has been a great increase in jaundice since the war, not only among the troops but also among civilians, in particular school children and young adults. Most cases are examples of "infective hepatitis," which is now regarded as a more suitable term than "catarrhal jaundice" for this particular disease, because it is infectious and it primarily affects the liver cells. It does not begin as a catarrh of the duodenum and large bile ducts as used to be thought, and the jaundice is due to intrahepatic obstruction to the secretion of bile. Important points to remember about this infectious disease are the long incubation period (3 to 5 weeks), the pre-icteric stage of several days to a week or more, the direct droplet spread, and the tendency for familial cases to occur in chains and not in groups. The patient is most infectious in the pre-icteric stage, and probably ceases to be infectious after the jaundice appears. During epidemics, patients with anorexia, pains in the back or limbs, headache, and particularly nausea and vomiting with pain or tenderness over the pit of the stomach and the liver, should be suspect and immediately isolated. In school outbreaks any child who vomits should be sent home for 7 days and allowed to return only if no jaundice has developed. Ancillary diagnostic tests in the early stage of infection are bile-salts or pigment in the urine, a leucopenia with lymphocytosis, and evidence of liver dysfunction (positive van den Bergh or Takata-Ara reaction). *Formes frustes* are probably common, and they may supply the missing links in the epidemic chain. Obviously control presents many difficulties; fortunately the infection is not as a rule severe, but adult patients in particular must not be allowed to return to work until the jaundice has quite gone.

Other forms of jaundice more frequent since the war began are the post-arsphenamine jaundice in syphilitic patients and the so-called homologous serum jaundice which has followed (after an incubation of 2 to 4 months) the injection of certain batches of human serum given with yellow fever vaccine or as convalescent measles or mumps serum for protection against these diseases. Clinically the jaundice is similar in type (though fatal cases are less rare) to that of infective hepatitis, but does not seem to be infectious. Spirochaetal jaundice, spread from the rat by contamination of ponds and canals, mines, sewers, etc., is typically a more severe infection, but milder grades occur; a leucocytosis is a distinguishing feature from infective hepatitis.

Psoriasis

Q.—Psoriasis is thought by some to be an allergic disease, and there is no specific remedy for it, but some preparations relieve it for a time. I have found stilboestrol one of these, and it would seem to cure the rheumatism which is sometimes associated with the condition; but the cure is short-lived, and I would like to know of an analogous preparation which might last longer and give more complete relief.

A.—Some thirty years ago a millionaire, a victim of psoriasis, provided funds to endow a team of experts to discover the cause of this common and intractable skin disease. The investigations were profound and searching, but the experts failed. Their chief conclusion—that a limitation of the nitrogenous intake benefits psoriasis—is not now even considered. Then in recent years Grutz and Berger asserted that there was both a general and a local disturbance of the fat metabolism in psoriasis. Dodds, MacCormac, and Robertson (*Brit. J. Derm. Syph.*, 1942, 54, 212), repeating these experiments, were unable to observe any constant or definite improvement on a low-fat intake, or, conversely, an aggravation of the eruption on a high-fat diet.

Indeed, in all fields of research psoriasis has proved a veritable will-o'-the-wisp, and we have reluctantly to admit that we are still quite ignorant of its cause. There are therefore no grounds for describing it as an allergic disease, nor any constructive scientific principle justifying the employment of stilboestrol, except clinical observation, which is a complete answer until, or unless, it is disproved by contrary experience. This applies with more or less force to all these methods of general treatment—by arsenical medication, by injections of bismuth or mercury, by protein shock, and so forth.

The treatment of psoriasis is therefore mainly or exclusively the treatment of the eruption by external applications. Of these the most active is chrysarobin, in a 6 to 8% ointment, which, however, should be employed with certain reservations. First, it cannot be used above the neck; secondly, it produces conjunctivitis if it gets into the eyes; thirdly, it stains sheets and clothing permanently; fourthly, it should be used only under careful and continued supervision, preferably keeping the patient in bed. Tar and mercury are also frequently employed, as in Adamson's formula: ammoniated mercury 10 gr., liquor picis carbonis 1 drachm, and vaseline to the ounce. Or oil of cade 1 to 2 drachms in salicylic acid ointment one ounce. Success depends upon the vigorous and thorough application of the remedy. Ultra-violet irradiation clears up the eruption in many cases, the patient appreciating the freedom from grease and the shifting of the responsibility for treatment to another. Small doses of x rays are also used in suitable cases—for example, an eruption limited to the elbow. But the cumulative effect of this form of treatment must always be kept in mind, and it should therefore never be used except under expert supervision and by a practitioner fully versed in superficial radiotherapy.

Enlarged Prostate

Q.—Is there evidence that methyl testosterone is of value in the treatment of early prostatic enlargement? Is such treatment worth while, bearing in mind the possible carcinogenic factor of the hormone, and, if so, over what period should dosage be continued?

A.—There is a good deal of experimental evidence that benign hypertrophy of the prostate is of endocrine origin. There is some clinical evidence that the administration of androgens may arrest further development of hypertrophy of the middle lobe, but on the whole the treatment of the enlarged prostate with androgens has been disappointing. At any rate it would seem that the first essential of such treatment is adequate dosage, and it is doubtful whether this would be obtained with the doses of methyl testosterone by mouth which are now popularly employed. The usual procedure, if androgen therapy is decided upon, is to give injections of, say, testosterone propionate 25 to 50 mg. (or even more) weekly for 3 or 4 months, and if no relief is obtained to consider the possibilities of surgery. The cancer bogey has been raised frequently in the course of discussions on oestrogen therapy. So far as is known androgen has up to the present not been accused of being a possible pre-cancerous agent.

INCOME TAX

Income from New Zealand

"F.R.C.S." raises two points in connexion with this income: (a) the inspector of taxes suggests that he should drop his claim to Dominion income tax relief, if only the net amount of the income (i.e., after deducting New Zealand income tax) is assessed to British tax; and (b) whether he is liable to account for tax on that portion of the income which accrues in New Zealand but cannot be remitted to this country owing to Government restrictions.

* (a) We distrust these short cuts. The result for the year in question might not differ much—that depends on various facts; but the only safe way is to claim what the law gives—i.e., the Dominion income tax relief. (b) He is liable in law, but if payment of tax on the unremitted portion of the income would impose hardship—as it very well may do—we understand that collection of that tax can be held over to be dealt with as and when the income withheld is in fact remitted.

Expense of Travelling to London

"A. H." inquires whether expenses incurred in travelling to London for (a) meetings of the Royal Society of Medicine and attending hospitals for postgraduate instruction are allowable.

No; it would, we believe, be held that such expenses are not in the carrying on of professional work, but in raising the level of professional ability and knowledge.

Deduction for General Expenses

"SIGMA" has a small specialized practice for which he uses a consulting-room (exclusively) and the dining-room as a waiting-room. The maid acts as receptionist and attends to the telephone. (He is also part-time assistant in another practice, but this does not affect the question raised.) The house is assessed at £70 per annum. What would be a reasonable allowance from the profits of the practice?

* So far as the rent, rates, etc., of the premises are concerned, we would suggest, say, 20% as a fair charge. The proportion of the maid's time is difficult to deal with as it depends on the amount of work she has in connexion with the private practice. "Sigma" can probably make an estimate as to the proportion of her time spent on that work. No allowance is due in respect of the part-time assistant work unless the principal requires "Sigma" to maintain a consulting-room for the purposes of his (the principal's) practice.

LETTERS, NOTES, ETC.

Atmospheric Pollution with Cement-Dust

Mr. P. G. BOWIE (Cement and Concrete Association) writes: My attention has been drawn to Mr. D. W. Standley's letter (Nov. 13 p. 622), and while I appreciate his point that too close an association between housing and industry may not—on account of noise atmospheric pollution, or for other reasons—be desirable, I would ask that any statement concerning cement manufacture which is published in a journal of such high standing as your own should be based on fact. Cement is not powdered until after it has left the kilns, consequently cement dust does not pour out of the chimneys. What is often visible is the cloud of steam evaporating from the wet clay from which the cement is made. Flint dust is not used in the manufacture of cement, and you may be certain the having gone to the expense and trouble of making and then crushing the cement to powder the manufacturers do all in their power to minimize any loss of material.

Pleuro-pericardial Rub

Dr. W. TREVOR COOKE (Birmingham) writes: The signs and symptoms given in the question "pleuro-pericardial rub" (Oct. 23 p. 533) are very similar to those described by Hamman (*Johas Hapt. Hosp. Bull.*, 1939, 54, 1). He called attention to the significance of previously recorded cases, and reported 7 cases under the term of "spontaneous mediastinal emphysema." The condition is benign and is frequently confused with coronary thrombosis owing to the intense pain and collapse that may be present, and with pericarditis due to the auscultatory findings. Six of Hamman's cases were under the age of 35. In view of the ease with which the diagnosis may be confused with more serious conditions, spontaneous mediastinal emphysema should be more widely recognized, and the possibility of its occurrence should be considered in the case discussed in the question.

Wilson's Disease

Dr. A. J. GLAZEBROOK writes from Edinburgh: The question of a family history of encephalitis lethargica is discussed in the *Journal* of Nov. 13 (p. 631). In a few cases of Wilson's disease the I have seen the condition has usually been misdiagnosed as encephalitis lethargica. This rare condition is familial. One of the cases I have seen was clearly hereditary. The fact that "the girl has an attitude and a way of speaking which are a trifle lethargic," and the family history, suggest to me that Wilson's disease should be excluded before child-bearing can be safely advised. I am interested in hepato-lenticular degeneration and would be grateful for further details of the case.

Subungual Haematoma

Dr. J. BARR STEVENS (London, N.4) writes: The easiest way to treat this condition is as follows. Having cleaned the toe or finger as much as possible, run a tenotomy or other straight knife down to the base of the nail, above the nail but below the cuticle, and turn it sideways with the cutting edge down. Blood will immediately escape by the side of the knife and give relief. The procedure can be done so quickly as to be practically painless, and is quicker and easier than attempting to perforate the nail with knife or drill.

Leicester Christian Medical Association

Dr. E. K. MACDONALD, medical officer of health, Leicester writes: I have been instructed, as honorary secretary to the above association, to advise you of its formation. Some little while ago a meeting was held of medical practitioners in this area who felt that it was most desirable that the influence of Christianity should be borne in mind in our practice of our profession, and it was decided to form an association with the object of promoting the profession and practice of Christianity among the medical men and women resident in the city of Leicester and counties of Leicestershire and Rutland. Any medical man or woman in the area who accept the Christian Faith is eligible for membership. Honorary members have been invited, and have accepted our invitation, from the three main Christian denominations—viz., the Lord Bishop of Leicester and the Very Reverend Father Prior (Roman Catholic), and the President of the Free Church Council. In addition, two associate members from each of the three denominations have been appointed from among the clergy. Up to the present we have some forty members and our first meeting, which was held recently, was addressed by the Bishop of Leicester, who dealt with the question of co-operation between the clerical and medical professions. An interesting programme of meetings has been arranged during the winter. The chairman of the association is Dr. J. V. C. Braithwaite and the council is representative of all denominations.

Corrigendum

Mr. G. F. LANGLEY wishes to correct a serious error in his article on gunshot wound of the innominate artery published in Dec. 4 (p. 711). In lines 13 and 14 of the clinical history the sentence should read: "There was a round wound half an inch in diameter just above the midpoint of the right clavicle."

BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 25 1943

THE POPULATION PROBLEM OF INDIA

BY

D. B. BLACKLOCK, C.M.G., M.D.

Professor of Tropical Hygiene, School of Tropical Medicine, University of Liverpool

The health or welfare officer of the near future will doubtless find himself in a more favourable position than his forerunners of to-day, and it may be well for us to examine some of the possible consequences of the change, not all of which must necessarily be good. Reasons now exist for anticipating great betterment in the health prospects of all peoples, and seemingly trustworthy political utterances portend developments which will certainly upset previous calculations. Countries like India, which at the present time suffer most severely from preventable disease, are exactly those in which the ameliorative changes will provide the most spectacular results.

Even a few years ago the idea that the adequate treatment and the successful prevention of disease might entail weighty political and administrative consequences would have seemed absurd, and it may still seem so to many people to-day. But I venture to think that such results will indeed occur—and, moreover, that they will be very grave indeed—if the aspirations expressed by some of the framers of our post-war policy are translated into practice. For example, the Atlantic Charter has implications which deserve the careful study of all health officers, under which title we must include not only the medical profession but also all welfare and social workers. They will presently encounter questions which need an immediate answer. If the valid promises contained in the Atlantic Charter are fulfilled, what are the kinds of consequences which we may expect? This Charter has been called an epoch-making declaration. It is incumbent upon us to try to foresee, if we can, the sort of epoch which may be produced by it. The case of India at once suggests itself for consideration.

The Malthusian Doctrine

Malthus, in 1798, based his arguments about population increase on his two natural laws: the first, that food is necessary for the existence of man; the second, that passion between the sexes is inevitable and will remain in its present state. He concluded that the power of increasing population was greater than the power of the earth to produce sustenance for man, and that therefore vice and misery must periodically ensue.

However, the increase of population in geometrical progression, coupled with an increase of the means of subsistence in arithmetical progression, as accepted by Malthus, could not, in a limited area, continue for very long. The time would soon come when the various classes of the population would have reached that standard of living—dictated by their accepted ideas of a reasonable subsistence—below which they were not prepared to descend. If a rising population were then allowed to continue its increase at the same rate as before, even for a very brief time, there would be nothing for the new arrivals to live on. The strange stage of affairs postulated by Malthus, at which masses of people with no means of subsistence could yet contrive to keep on propagating their species freely—in a nutritional vacuum as it were—could not actually be reached. But there could and undoubtedly would come a point beyond which any additional people must perish of hunger. An increase of population in a place where the means of subsistence is no longer capable of expansion does in fact involve starvation.

George in 1889, writing of the Malthusian theory, was emphatic in his denial of its truth: "Examination," he wrote, "... shows that this doctrine has no real support either in fact or in analogy, and that when brought to a decisive test it is utterly disproved." It is of interest to note that Darwin, in Chapter III of his *Origin of Species*, when describing the nature of the struggle for existence, stated that "it is the doctrine of Malthus applied with manifold force to the whole animal and vegetable kingdom."

Great public attention should be paid to one statement for which George was responsible. He wrote: "Even if it be admitted that the tendency to multiply must ultimately produce poverty, it cannot from this alone be predicated of existing poverty that it is due to this cause, until it can be shown that there are no other causes which can account for it—a thing, in the present state of government, laws, and customs, manifestly impossible."

The Land Policy of George

For the cure of poverty the sovereign remedy proposed by George was the taxation of land values:

"Taxes may be imposed upon the value of land until all rent is taken by the State, without reducing the wages of labour or the reward of capital one iota; without increasing the price of a single commodity, or making production in any way more difficult.

"But more than this. Taxes on the value of land not only do not check production as do most taxes but they tend to increase production, by destroying speculative rents. How speculative rent checks production may be seen not only in the valuable land withheld from use, but in the paroxysms of industrial depression which, originating in the speculative advance of land values, propagate themselves over the whole civilized world, everywhere paralysing industry, and causing more waste and probably more suffering than would a general war. Taxation which would take rent for public uses would prevent this; while if land were taxed to anything near its rental value, no one could afford to hold land that he was not using, and consequently, land not in use would be thrown open to those who would use it. Settlement would be closer, and, consequently, labour and capital would be enabled to produce much more with the same exertion. The dog in the manger who, in this country especially, so wastes productive power, would be choked off."

It should be carefully observed that in this passage George was directing the thoughts of his readers to *existing* poverty. His violent objection to the Malthusian argument was based on his belief that Malthus assumed that the *existing* poverty so painfully evident on all sides was due to an already operating pressure of population on the means of subsistence. George argued that population-pressure could not be the explanation of this kind of poverty, since there were vast areas of productive land, not only abroad but also at home in America, which were still entirely undeveloped. This failure to utilize natural resources he traced to one fact—the existence of the right of private ownership of land.

George's apparently casual expression, "even if it be admitted that the tendency to multiply must ultimately produce poverty," is one which we should now note; it is fundamental. This most significant statement seems worthy of far greater attention than has ever been given to it. Does it not tell us that George himself harboured inner reservations as to what

might be the ultimate outcome, even in places where his policy of taxation of land values had been put fully into operation?

Some Assumptions, and the Prospect in India

However this may be, let us ourselves be bold enough to make certain assumptions with regard to India and to discover whither they will lead us. The assumptions which we shall permit ourselves to make are somewhat as follows:

1. That the most favourable agrarian policy—better, it may be, than the taxation of land values, or than nationalization by State purchase, or allotment of the land to the people by declaration of Government, as in Northern Nigeria—has been put into effect. All the land, therefore, has by some means been made accessible directly or indirectly to the enterprise and industry of every person in the State.

2. That the land so freed for development is being fully utilized for agriculture, forestry, and mining, with the aim of reaching the maximum production of all kinds of goods.

3. That this freedom to produce goods from the land has been supplemented by the complete freedom to trade in them which the Atlantic Charter has forecast in a provisional way.

4. That, in addition to the above, a conscious and large-scale effort is being made to provide proper housing, adequate clothing, suitable food, good education, and the best possible medical care for everyone. (The promise of all these things seems implicit in the Atlantic Charter.)

5. That health officers and welfare workers are therefore afforded every facility for applying universally the vast knowledge of disease prevention and treatment already in existence and all the scientific advances which may accrue in the future.

Then, if these assumptions are accepted as correct, or even as correct in large part, let us try to consider in an unprejudiced way what the prospect is likely to be in an already densely populated and disease-ridden country such as India.

According to the census of 1941 the total population of all India (British India and Indian States) was 388,800,000. This number is distributed mostly in village communities over a total area of 1,576,000 square miles—i.e., about 247 persons per square mile. It is still a rural population. There are over 500,000 villages, and only 37 of the towns have populations over 100,000.

It has recently become evident that the duty of adjusting their internal political and economic outlook to meet the new conditions will devolve upon the people of India themselves. This development has long been foretold. Lord Macaulay in 1834 understood well that experience of administration would lead to a demand from the people of India for European institutions. "Whether such a day will ever come, I know not, but never will I attempt to avert or retard it. Whenever it comes, it will be the proudest day in English history." The future from the medical point of view already lies largely in the hands of the Indian people themselves. Even now, in the civil medical department of India, out of a total of six thousand fully or partly qualified medical men fewer than two hundred are British.

There can be few thoughtful Indians who will claim that the present state of affairs in regard to the health of the people of India is satisfactory. A recent official report states that "the village house is still ill ventilated and over-populated; the village site dirty and crowded with cattle, choked with rank vegetation, and poisoned by stagnant pools; and the village tanks polluted and used indiscriminately for bathing, cooking, and drinking."

Haward attributes the slow rate of progress in India to financial causes: "Conservative finance—prudent in an administration working in a country where standards of living are low—has prevented rapid acceptance of elaborate measures for educational development and for establishing public health organizations on European lines." He refers to the terribly high rate of infant mortality in India, but nevertheless, in spite of all these drawbacks to health, he has to write: "The population had increased by 40% in 1931 as compared with 1881, while the increase in 1941 over 1931 has proved to be nearly 15%."

According to Wattal, Hindus believe that perdition awaits a woman who dies unmarried or a man who dies without a son; for Hindus, therefore, marriage is an almost compulsory sacrament. A Hindu male must marry and beget sons who

will perform his funeral rites, lest his spirit should have to wander uneasily in the waste places of the earth. It is said that the very name of son, *putra*, means one who saves his father's soul from the hell called *Put*. A Hindu maiden unmarried at puberty is a cause of social obloquy to her family and of potential damnation to her ancestors. It has been observed that Muslims are not handicapped by any such penalties—though they have a saying of the Prophet that "when a man marries verily he perfects half his religion." Yet among them also the married state is equally esteemed—partly, it may be, owing to Hindu example, but partly also owing to the conditions of life in a primitive society, where a wife is almost a necessity both as a domestic worker and as a helpmate in the field. When Wattal wrote in 1934 there was in India a total population of about 353 millions, and of these no fewer than 83 million females and 84 million males were said to be married. The potentialities for increase of population are illustrated locally by the State of Travancore in Southern India, which in one year recorded a birth rate of 41.5 per thousand and a death rate of only 16 per thousand. Even higher birth rates than this are recorded.

Taking India as our example, it is hard to avoid the conclusion that an enlightened land policy and the putting into practical effect of the terms of the Atlantic Charter, coupled with the continuance of the above views on marriage and production of families, are bound to produce acute economic and political difficulties. Such a condition of over-population may be anticipated as can lead only to one result—starvation. If a sequence of events such as that suggested is likely to occur—and I think that it will occur very soon if the assumptions are correct—then we ought now to be preparing plans for dealing with the problems which will arise. In anticipation of the time when neither further irrigation schemes nor more scientific treatment of the soil can result in increased production from the land, Indian statesmen must have some policy ready by which great disaster to their country may be avoided.

The Doctor's Duty

Medical officers and social workers will not find it a pleasant reflection that the more they succeed in alleviating human suffering and in preventing disease the more rapidly will they reach, in some countries, a stage at which nothing but starvation looms ahead. Taking the reaction of medical men and women to such probabilities, there are several courses open. They may elect to wash their hands of all responsibility in the matter, to leave things severely alone, and to let the politician and Nature take their course. That, no doubt, would be to follow the line of least resistance, but it is diametrically opposed to the aims of medical science. The days are gone, never to return, when an attack of malaria was accepted as a warning of Divine displeasure, when for a surgeon to straighten a crooked limb was to cast doubt upon the perfection of Creation, and when the agony of the pains of labour had to be endured because so it was ordained. No doctor to-day will assent to any restraint which would deprive him of the privilege of relieving, as best he can, the immediate suffering of man, woman, or child. Nor will any doctor accept the ignominy of being compelled to stand idly by and watch a preventable disease spreading and taking its toll of human life. On the contrary, the doctor will insist on pointing to all the diseases which are already preventable—for example, diphtheria, yellow fever, plague, smallpox, and many others—and will demand to be given means by which he may take the steps necessary to prevent them. The doctor feels no doubt whatever about the line of action which he must follow. So far as he is concerned his duty is absolutely plain: it is to relieve the suffering patients and, so far as lies in his power, to prevent all human disease. Where malnutrition exists, all social and welfare workers will use every endeavour to reduce it and to obviate its recurrence.

Post-natal and Natal Checks on Population

India has almost the highest death rate of all countries; it is more than double that of England and Wales. That the position of India among the nations is by no means enviable in regard to its present death rate, but if the money and the necessary staffs were available that death rate could with certainty be greatly reduced. It may be argued, however, that

in spite of the application of scientific knowledge to such a country as India, Nature will always provide suitable and satisfactory checks upon population. The checks which Nature may impose ought therefore to be considered.

Warfare is a post-natal check which acts for a period, but its effects are largely on the male section of the community. Apart from the reduction of the numbers of males brought about directly by death in action and death from wounds, there are also certain other less-specialized losses which may result from war. For example, the destruction of crops may lead to wholesale malnutrition or even the starvation of large numbers of the general population. The conditions of existence imposed by warfare will frequently tend to increase the virulence and the rapidity of spread of disease. The influenza epidemics of 1917 and 1918 were held responsible for more deaths than were caused by enemy action. Moreover, like war, catastrophes of Nature, such as floods and earthquakes, may have both direct and indirect consequences. The floods which occur periodically on the Yellow River in China, for example, may result in numerous deaths from drowning. The 1934 Bihar earthquake caused the death of thousands of persons directly, and the death of thousands indirectly owing to starvation. In the Quetta earthquake 25,000 persons are said to have been killed. The deaths due to starvation and disease consequent on such catastrophes often exceed the deaths caused directly.

Furthermore, in densely populated areas numbers of deaths from starvation, or from disease to which malnutrition predisposes, may be expected to follow upon crop failures due to such milder derangements as excessive drought or frost. The existence of a Famine Code in India and of an Indian Famine Trust, intended to give monetary assistance to persons in districts affected by a shortage of rainfall, indicates the seriousness of the risks even now being constantly run in that country. Many diseases, especially in epidemic form, may wipe out a large proportion of a local population; influenza and plague are instances of disease which may reduce populations over fairly wide areas. Among the post-natal checks on population one of the most important in countries with low standards of living is excessive infant mortality.

With the exception of warfare, all the foregoing post-natal checks may be classed as involuntary, inasmuch as normal people would avoid them if they could. But in the post-natal period there are also voluntary checks, and these the parent or the community can apply. Infanticide by exposure of unwanted children and by other means is in several countries not unknown even to-day. The killing of twins, as practised among certain peoples, is a system which, whatever its original significance, may have some effect in limiting population by preventing twin-bearers from reproducing.

Natal checks include stillbirths and deaths of mothers at childbirth. How important the natal factor is can be concluded from the stillbirth rates and the high figures of maternal mortality. The figures given by Megaw for maternal mortality are worth noting here. He estimates that in India 200,000 mothers die in childbirth every year.

Prenatal Checks

Prenatal artificial checks in the post-conception period include all methods at present employed for causing miscarriage or producing abortion. The reduction of population which results from these means comprises all children unborn and all the mothers who succumb to the effects of the drugs used or of the mechanical operations performed, as well as all the later children who might have been born to these mothers had they survived. It may be observed that none of these prenatal methods can be considered devoid of risk. The safe production of even early abortion involves a surgical operation which requires precaution if it is to give the mother a fair chance of survival in a good state of health. As regards preconception checks, we may here leave out of consideration mechanical means of sterilization of the male and female. These are also operative procedures which involve risks. It may be possible to impose them by statutory means on those whose offspring are not welcomed by the State, but only in the case of persons who are not free. They are never likely to be accepted voluntarily by any large number of free peoples.

Among normal and civilized people it is at a stage before conception has occurred that a check on population is most often adopted and may most safely be undertaken. One method—that which is called the ideal one—is for men and women to abstain voluntarily from marriage, or, more broadly speaking, from reproduction. Religious celibacy has its effect on population, as also has secular common prudence, as when men put off marriage till late in life because they cannot afford to keep a wife and children. But much more usually it is the employment of contraceptives which provides the solution of any dreaded over-population problem among careful people with forethought. To what extent, if any, the frequent use of chemical or mechanical contraceptives finally impairs health is as yet by no means certain, and no doubt it will be some years before convincing evidence can be collected and sifted. That the immediate physical and mental risks are not considered great, however, seems already to be widely accepted.

Conclusion

We may sum up by concluding that if the world achieves lasting peace, if the maximum productive use of land is practised, and if, moreover, there is a sustained effort to apply our knowledge to the betterment of the health of man by attention to the prevention of disease and to improving housing, environment, and nutrition, then India, with all these newly acquired aids towards increase in the numbers and the good health of families, will be so rapidly populated that starvation will inevitably result, and that soon. In order to avert this it will be necessary for the politicians and administrators of India—as it presently will be for those of certain other countries—to make up their minds on what is to be their standard of living, and on the number of people which the land will support at that standard. Having determined this, they will then be compelled either to educate their peoples up to a high level of moral restraint or to educate them in the practice of contraceptive methods. Only so will they be able to limit the numbers of the population to the figure indicated by those standards of living which they have chosen and to avoid the starvation of many of their people.

INFECTIVE HEPATITIS

WITH SPECIAL REFERENCE TO THE ORAL
HIPPUIC ACID TEST

BY

IAN GORDON, O.B.E., B.Sc., M.B., M.R.C.P.

Major, R.A.M.C.

During the period Dec., 1941, to Sept., 1942, there were admitted to hospital 168 cases of infective hepatitis in the Middle East Forces. This figure does not include 50 cases of jaundice in persons undergoing antisyphilitic treatment, which are considered elsewhere. The patients came from certain base units, from rest and training camps, and from the forward areas in the Western Desert. The epidemic reached its peak in the early autumn (September), but figures showing the seasonal incidence would be misleading, since there were often large troop movements in the area served by the hospital. For the same reason it was difficult to trace contacts and so to assess accurately the incubation period of the disease. It was estimated at 4 to 5 weeks. Booth and Okell (1927-8) consider the incubation period to be not less than 20 and not more than 40 days. Excellent epidemiological studies have been carried out in rural districts in England by Pickles (1930, 1939) and Newman (1942), who have brought forward fairly conclusive evidence of an incubation period of 26 to 35 days.

Onset and Pre-icteric Stage.

The disease for the most part affected the apparently healthy. In the war of 1914-18 so-called catarrhal jaundice was common in the Middle East. Bacillary dysentery and diarrhoea were so frequently associated with the onset of the illness that

a suggestion was put forward that there was a definite relationship between the two diseases. In this series dysentery and diarrhoea were associated with the onset in only 19 cases. This remarkable difference is not due to any change in the character of the disease, but is the result of more efficient hygiene and sanitation, which during this war has been a feature in the Middle East.

A few epidemics have been associated with sore throat, notably those recorded by Fraser (1935) and Glover and Wilson (1931). No such association was noted here. General debility, sore throat, respiratory infection, or skin sepsis preceded the onset of the disease in only 8 cases. While there was wide variation in the clinical picture in the pre-icteric stage, two fairly distinct types of onset were recognized: (1) cases in which there occurred a well-marked febrile attack, and (2) cases in which no febrile attack was observed. In the great majority of cases the pre-icteric stage had passed and jaundice had developed before admission to hospital, but in such cases notes on the prodromal symptoms from regimental medical officers were of great value. Only occasionally was it difficult to determine the type of onset.

Group 1: 88 Cases with Febrile Attack

The onset was usually sudden, often with shivering and occasionally with a rigor. Fever ranged from 100° to 102°, the highest recorded temperature being 104°. The pulse rate usually varied from 80 to 90, and often dropped to 50 or 60 when jaundice became established. Headache, mostly frontal or retro-ocular, was common, and was noted in 85%. It was rarely bitemporal or occipital. A few patients complained of photophobia and pain on movement of the eyes. Giddiness was noted occasionally, and malaise, rarely amounting to lethargy, was almost constant. Two-thirds complained of backache and/or pains in the limbs.

Gastro-intestinal symptoms were universal in some form or another, and sometimes their appearance was delayed until the third or fourth day of the illness. Loss of appetite was complained of in all but three cases, and nausea, vomiting, and abdominal pains or discomfort were common. Constipation occurred in just over one-third, and mild diarrhoea in 9%. The average duration of this prodromal stage before the appearance of jaundice was 5.8 days, and in one case it lasted as long as 17 days.

Group 2: 80 Cases without Febrile Attack

The pre-icteric stage in this group was of slightly shorter duration, averaging 4.1 days. In 8 cases jaundice was the first symptom to be noted, and the longest duration of this stage was 18 days. Slight frontal headache was complained of in one-third, and, though no definite febrile attack occurred, a few cases had fever from 99° to 100°. The great majority, however, were afebrile.

Gastro-intestinal symptoms were evident from the first and, though similar to those in the "febrile" group, were not so constantly present. A number of patients complained of relatively few gastro-intestinal symptoms, and 8 would admit

of food the nausea was so intense or the feeling of distension in the abdomen so great that they could eat no more. Malaise, a bad taste in the mouth, and disinclination for smoking were common. Vomiting, especially after fatty foods, was noted in 49%. Abdominal discomfort or pain was complained in the right hypochondrium or mid-epigastrium, and was described as a soreness, fullness, tightness, a dull ache, a feeling of distension, or, rarely, as severe pain. Sometimes this discomfort was confused with nausea. Heartburn and flatulence were not uncommon, and in one-quarter the bowels were constipated. Suffusion of the conjunctivae, as noted by Be (1936) and Newman (1942) in children, was not observed. In both groups dark urine was noticed usually one to three days before the onset of jaundice.

Icteric Stage

After the appearance of jaundice the physical findings and subsequent clinical course were almost identical in all respects in two groups. When jaundice became evident, first in the conjunctivae and then in the face and neck, fever in Group 1 abated and constitutional and gastro-intestinal symptoms tended to disappear. In fact, as soon as the yellow tinge of jaundice appeared most patients began to feel well and to eat heartily. Very occasionally low fever continued for a day or two in the icteric stage.

The persistence, for a few days in the icteric stage, of anorexia, nausea, abdominal discomfort, and sometimes of vomiting occurred in one-quarter of all cases, and the symptoms were generally associated with clay-coloured stools. With the return of pigmentation in the stools the troublesome symptoms usually disappeared. Vomiting was so severe in 3 cases that intravenous saline with glucose was administered, with rapid improvement. Paresis of accommodation—a serious symptom—occurred in one deeply jaundiced patient, but disappeared quickly after the administration of glucose saline intravenously. The tongue was clean in the majority of cases—an interesting observation in view of the fact that discoloration of the liver is commonly said to be associated with a coated tongue. Tenderness in the epigastrium and in the right hypochondrium was common.

Enlargement of the liver was detected in 49% of cases in Group 1 and in 51% in Group 2. The liver became palpable and was invariably tender at the first appearance of jaundice or, less commonly, within a few days of its onset. The liver edge extended on average to 1½ fingerbreadths below the right costal margin. There was a definite relation between the size of the liver and the duration of the icteric stage. Though in a few cases of prolonged jaundice the liver never became palpable, it is clear (Table II) that the longer the liver the longer the duration of jaundice. In giving a prognosis it is helpful to remember that gross hepatomegaly is associated with severe and persistent jaundice. The enlargement in the average case lasted for about a week. In some cases hepatomegaly was transient, lasting for only two to three days; in others it persisted for three to four weeks.

TABLE II

No. of Cases	Size of Liver	Average Duration of Jaundice
2	3-4 f.b.	62.0 days
19	2-3 f.b.	34.4 "
63	1-2 f.b.	24.4 "
84	Not palpated	20.0 "

The spleen was palpable in 6 cases in Group 1 and in 10 cases in Group 2 (average total, 10%). The enlargement usually appeared within a week, and in all but one case was associated with hepatomegaly.

Duration of Jaundice.—In over two-thirds of cases jaundice lasted from 15 to 35 days. It usually developed rapidly and reached maximum within a few days; after a varying time it began to fade slowly. The depth of jaundice varied considerably, and in a few cases only the conjunctivae were tinged. In "febrile" cases the average duration of jaundice was 23.4 days, and in the "non-febrile" group it was 25.3 days; 24 cases (14%) out of 168 had an icteric stage which lasted more than 35 days, the longest duration being 81 days.

Leucocyte Count.—The leucocyte count in the pre-icteric stage and during the first three days of jaundice ranged from 3,100 to 8,800 per c.mm. (average 5,800 per c.mm.). A leucopenia with relative lymphocytosis and monocytosis is described as a common finding, and this was present in a number of cases. It was more common, however, for the leucocytes and the differential count to be within normal limits. The average differential count during the first three days of icterus was (20 cases): polymorphonuclears, 54% (44-64%); lymphocytes, 39% (30-52%); monocytes, 5% (1-10%) (Other cells not included.)

TABLE I

	Cases with Febrile Attack	Cases without Febrile Attack
	(%)	(%)
Headache	76	76
Retrolateral headache	34	2.5
Headache and limb pains	51	32
Anorexia	64	14
Nausea	97	83
Vomiting	85	71
Abdominal discomfort or pain	56	49
Constipation	51	45
Diarrhoea	36	25
	7	9
Duration of pre-icteric stage	5.8 days	4.1 days
Duration of jaundice	23.4 "	25.3 "

of no previous symptoms whatsoever. In most cases anorexia was complete; in others (17%) appetite for food remained good or was only slightly affected. Many patients said they would sit down to a meal, but after eating a few mouthfuls

Stools.—The stools were clay-coloured or light brownish at some time or another in the majority of cases. Their appearance was usually noticed by the patient at or before the onset of jaundice, but was sometimes delayed until jaundice had been well established. In a few cases they appeared intermittently, and in others every stool passed was well coloured with pigment.

Urine.—Dark-coloured urine was noticed by most patients one to two days before the appearance of jaundice; but sometimes it was observed every day during the previous week, and 11 patients said they had noted dark urine 7 to 14 days before the occurrence of jaundice. A small quantity of albumin was found in the urine of a few patients during the first two or three days of jaundice, and in some instances occasional granular and hyaline casts were present. In 60 cases an early morning specimen of urine was examined daily or on alternate days for bile (Gmelin's test), bile salts (Hay's sulphur test), and excess urobilinogen (Ehrlich's diazo reagent). The average duration of biliuria as estimated from the day of appearance of jaundice was 14 days, and bile salts were detected for three to four days after the test for bile became negative. It will be generally agreed that both Gmelin's nitrous acid test and the iodine ring test for bile pigment in the urine are unsatisfactory, since in the latter stages of jaundice, when excess bilirubin is still present in the blood, these tests for bile are negative. Excess urobilinogen was found in the late pre-icteric stage and in many cases during the first few days of jaundice. The test was usually, but not invariably, positive when the stools were clay-coloured or light brown. This may be regarded as evidence that stoppage of bile-flow was usually incomplete, since the formation of urobilinogen depends on the presence of bile pigment in the intestine. It has already been shown (van Rooyen and Gordon, 1942) that, in cases of infective hepatitis when the stools are clay-coloured, quantities of bile can be obtained by duodenal intubation. Occasionally, however, excess urobilinogen was absent in the presence of clay-coloured stools. In one severe case, in which jaundice lasted 55 days and the stools were clay-coloured for 14 days, excess urobilinogen was never present in the urine. Probably in this case there was complete stoppage of the flow of bile, so that in the absence of bile in the intestine no urobilinogen was formed.

Diagnosis in the Pre-icteric Stage

The initial febrile attack in cases in Group I resembled, and was often confused with, sandfly fever and malaria, but the distinguishing feature in these cases was the presence of gastro-intestinal symptoms, especially anorexia and nausea. Diagnosis was difficult when the appearance of these symptoms was delayed for a few days.

Pneumonia, meningitis, and septicaemia had occasionally to be excluded when fever was high in the pre-icteric stage, and in such cases the leucocyte count was of great assistance. The enteric group of fevers, especially paratyphoid fever, had not infrequently to be considered. In 2 cases abdominal pain was so severe that a diagnosis of acute appendicitis was made by the medical officer. In patients without an initial febrile attack the gastro-intestinal symptoms were sometimes confused with an alcoholic "hang-over"—an excusable mistake, as the symptoms are almost identical. Many of these cases, before the appearance of jaundice, were also labelled "gastritis" or "dyspepsia."

The main diagnostic aid in the pre-icteric stage, however, is the presence of bile pigment and bile salts in the urine. Excess urobilinogen is also found at this stage, but its presence must be interpreted with caution, since it occurs in excess in the urine in malaria, and indeed when pyrexia is high from any cause. Excess urobilinogen in the urine of afebrile cases is of much more diagnostic value. Confirmatory evidence of subclinical icterus may be obtained by removing a sample of whole blood in a dry syringe and estimating the icteric index or serum bilirubin.

The histamine intradermal test described by Brodribb and Cullinan (1936) as diagnostic for subclinical icterus was carried out in a number of cases, but gave disappointing results. The test was rarely positive before the appearance of bile pigment in the urine.

Other Symptoms

Itching was not a usual complaint, and was recorded in only 9 cases. Occurring usually but not invariably at the height of the jaundice, itching was for the most part generalized, and was sometimes severe enough to prevent sleep. Apart from an accompanying persistence of anorexia and nausea in 3 cases, itching could not be associated with any particular symptom or sign, nor did it bear any relation to the severity or duration of the jaundice.

Urticaria occurred in 5 cases, none of which gave any previous allergic history. In one case it appeared on the sixth day of jaundice, but in the others it was noted late in the disease when the jaundice was decreasing. Slight epistaxis occurred in a few cases.

Relapses and Complications

When jaundice had almost or totally disappeared, there occurred in 5 cases a sudden relapse with deepening of jaundice, lasting on the average six to seven days. In one case the relapse, which appeared to have been brought on by a severe cold in the head lasted three weeks. No satisfactory explanation for these relapse can be offered. They occurred in the more severe cases.

Death from acute necrosis of the liver is fortunately a rare occurrence, and there were no such cases in this series. Some of the more severe cases suffered from a considerable amount of debility, but otherwise there were no complications.

Liver Function Tests

Hippuric acid liver function tests by the oral method were carried out in a number of cases at various stages of the disease. This test, devised by Quick (1936), is a measure of the power of the liver to convert benzoic acid to hippuric acid, and is considered to be an index of the "detoxifying" power of the organ.

Briefly, it is carried out by giving orally 6 g. of sodium benzoate in the early morning and collecting for four hours complete hourly specimens of urine. The hourly excretion of hippuric acid is remarkably constant in the normal adult, who will excrete about 3 g. of sodium benzoate (in the form of hippuric acid) in four hours. Three grammes is chosen as the average normal for calculating the output in terms of percentage of normal. Excretion of over 90% of this amount is regarded as non-pathological (Quick, 1940).

Attempts to correlate the oral hippuric acid test with the bromsulphalein and galactose tolerance tests have been made by Sneyd and Plunkett (1936), and their results indicate that the oral hippuric acid test is reasonably accurate and satisfactory. Mater and his co-workers (1942, 1943) have made a comparative evaluation of the newer liver function tests and are of the same opinion, though they found that the intravenous hippuric acid test was more sensitive than the oral method.

Quick's original technique was followed. The modifications of the test introduced by Weichselbaum and Probst (1939), Probst and Londe (1940), and others were not adopted. In the present series oral hippuric acid tests were carried out in the main at three stages of the disease: (a) when jaundice was at about its height (b) when jaundice had almost disappeared; and (c) after two to four weeks' convalescence, when jaundice had totally disappeared. Many results were confirmed by a repetition of the test. During the first three weeks of jaundice tests were performed in 14 cases of a grades of severity, the duration of icterus varying from 7 to 81 days. Evidence of impaired function of the liver of from 37 to 72% of normal was found in all cases. Similar results have been recorded by Quick (1936), Probst and Londe (1940), and Henderson and Splatt (1942).

In an attempt to compare the function of the liver in mild average, and severe cases, a number of tests were performed at the stage of the disease when jaundice had practically disappeared. A these patients were "up-patients" on ordinary diet, and jaundice had just disappeared from the skin and only a trace remained in the sclerotics. The icteric index ranged from 8 to 20. It is at this stage of the disease that patients are usually discharged from hospital, and it was considered desirable to obtain, in addition, some information as regards liver function at this time. That the liver was slow in regaining normal function in some cases was suspected on clinic grounds. We have seen in this hospital recurrence of jaundice in four patients (not included in this series) who had indulged rather than freely in alcohol during convalescence. It was thought that in these cases, although jaundice had practically or totally disappeared on discharge from hospital, liver insufficiency was still present, and the imbibing of alcohol had caused further liver damage, resulting in the reappearance of jaundice.

Hippuric acid tests performed in 29 cases when jaundice had almost disappeared revealed evidence of liver insufficiency in the majority. The results (Table III) show that in 19 cases (65%) the excretion of benzoic acid was less than 90% of normal, indicating an insufficiency of the "detoxifying" power of the liver. It will be observed that the type of onset, the duration of jaundice, and the presence or absence of hepatomegaly do not bear any constant relation to the function of the liver (as estimated by the hippuric acid test) when jaundice has almost disappeared. Indeed, fairly severe liver insufficiency may be present in relatively mild cases of jaundice (Cases 25 and 39).

Ten of the more severe cases showing abnormal hippuric acid tests on discharge from hospital were readmitted after two to four

weeks' convalescence for the performance of further tests. Jaundice had totally disappeared, and all these patients stated that they felt well and fit for duty. Urines were negative for bile and excess urobilinogen, and in no case was the liver palpable.

Of these 10 cases 6 gave evidence of recovery of liver function, while in 4 cases the excretion of sodium benzoate was less than 90% of normal, indicating insufficiency (Table III). Of the 4 cases showing liver insufficiency after total disappearance of the jaundice, one (Case 2) had been deeply jaundiced and for at least two weeks had passed stools deficient in bile pigment. In Case 4 the liver was palpable for the first four weeks of the illness. In the initial stages Case 6 was acutely ill with persistent vomiting, which required the administration of saline and glucose intravenously. The remaining case (No. 13) was an apparently average one of 28 days' duration, the liver being palpable for only a few days at the beginning of the illness. Cases with a clinical picture similar to these, however (Cases 1, 3, and 5), had normal hippuric acid tests. Thus it is not possible to detect, on clinical grounds, cases which will show insufficiency of liver function (as measured by the hippuric acid test) after the disappearance of jaundice. Whether complete recovery of the detoxifying power of the liver eventually occurred in these cases is not known, as it was not possible to follow them further.

TABLE III.—Hippuric Acid Test

Case No.	Duration of Jaundice (days)	Jaundice Disappeared from Skin; Present in Sclerotics (% of normal)	After 2-4 Weeks' Convalescence Jaundice Totally Disappeared (% of normal)	Liver	Remarks
1	81 NF	104% (9)	—	+ for 2 wks.	Severe case, with vomiting ++
2	55 F	67% (15)	77% (7)	0	
3	52 NF	61% (20)	103% (12)	+ for 6 wks.

28	11 NF	97% (8)	—	0	
29	3 NF	52% (8)	—	0	

Figures in parenthesis = Icteric index.
F = Febrile type of onset.
NF = Non-febrile type of onset.

Second Attacks

There are few references to second attacks of infective hepatitis. Findlay, Dunlop, and Brown (1931) have recorded a case in which jaundice recurred two months after the primary attack, and Bates (1936) described the case of a boy aged 15 years who had a recurrence of jaundice, more severe than first attack, 34 days after biliuria had disappeared. A recurrence three months after the first attack in a boy aged 35 years was noted by Newman (1942).

TABLE IV

Case No.	Intervals between Previous and Present Attacks (years)	Duration of Present Attack	Hippuric Acid Test when Jaundice almost Disappeared (Present in Eyes Only) (% of normal)
1	1	16 days	—
2	8	8 "	—
3	14	7 "	72%; later 84%
4	8 and 13	66 "	64%; later 86%
5	10	20 "	110%
6	15, 11, and 1	3 "	91%

In the present series 6 patients gave a history of one or more attacks of jaundice, which had occurred at least a year previously. These attacks had lasted from three to six weeks,

and the descriptions of them resembled average attacks of infective hepatitis.

It will be seen from Table IV that the subsequent attacks were, on the average, no more severe than an ordinary attack of the disease. Nor can it be said that there was evidence of much residual liver insufficiency. Hepatomegaly was not a feature in these cases, the liver being palpable in only 2 instances. Hippuric acid liver function tests carried out when jaundice had almost disappeared showed that there was little or no disturbance of the detoxifying power of the liver. Of the 4 cases tested, 2 showed normal liver function and 2 only slight impairment (84% and 86% of normal). In actual fact, at this stage in the disease there is no more disturbance of the detoxifying power of the liver in these cases than in cases which do not give a history of a previous attack. Unfortunately, it was not possible to perform further tests on these patients.

It will be appreciated that only one single function of the liver has been tested in this series of cases, and it is probable that had other liver function tests been employed different results would have been obtained. Evidence of liver damage many years after recovery from the disease has been discovered when other tests for liver function have been employed. Using the bilirubin excretion test, Soffer and Paulson (1934) found evidence of liver insufficiency in 9 out of 11 patients who had had catarrhal jaundice. In 6 of the 9 cases the attack had occurred 3 to 18 years previously. The degree of retention of injected pigment varied from 10.7 to 50%, and they remark that the severity of the attack bears no relation to the degree of residual hepatic involvement. Likewise, Bergmann (1932) found that many years after infective hepatitis there was evidence of liver insufficiency, as shown by the bilirubin and galactose tolerance tests.

Notes on Aetiology

During the war of 1914-18 so-called catarrhal jaundice occurred in epidemic form in the Middle East theatre of war. Much literature appeared on the aetiology of the disease, and the general opinion at that time was well summarized by Willcox (1919), who held the view that "epidemic catarrhal jaundice is due to an intestinal infection causing duodenitis and catarrh of the bile ducts. The area round the ampulla may be mainly affected, and in some cases there may be produced an ascending catarrh causing cholangitis. In either case obstructive jaundice may result."

During the last 20 years this type of epidemic non-spirochaetal jaundice, which is of world-wide distribution, has been extensively studied, and the view that jaundice is caused by local inflammation and obstruction has fallen into disfavour. A great deal of evidence now exists to show that icterus is caused by a hepatitis, the essential lesion being degeneration of the parenchymatous cells of the liver. The post-mortem evidence is well reviewed by Cullinan (1939) and Findlay (1940), and in the aspiration biopsy experiments of Roholm and Iversen (1939) diffuse hepatitis was demonstrated in all cases.

Hurst and Simpson (1934), Hurst (1940), and Barber (1937) recognize two different types, which they maintain can be differentiated on clinical grounds: (1) a primary hepatic necrosis (or infective hepatitis); and (2) true catarrhal jaundice which depends on obstruction to the flow of bile caused by catarrh of the duodenum and lower extremity of the common bile duct. Findlay (1940) also recognizes these two types, but is of the opinion that there are no symptoms by which true catarrhal jaundice can be differentiated from infective hepatitis.

In the present series there occurred cases the clinical picture of which were almost identical with Hurst and Simpson's clinical description of primary hepatic necrosis on the one hand and of true catarrhal jaundice on the other. The existence in the same epidemic of two clinical types each with an entirely different aetiology is unlikely. Furthermore, liver insufficiency as measured by the hippuric acid test was present in both clinical types. Cullinan (1939), in a review of 23 outbreaks in England, also considers that there is not enough evidence to justify the above subdivision.

Treatment:

Routine treatment consisted of a low fat and high carbohydrate diet, glucose twice or thrice daily, and a small dose of magnesium sulphate in the early morning. When the skin became free from icterus, patients were allowed up and were put on ordinary diet. When vomiting was frequent, excellent results followed the administration, by intravenous drip transfusion, of a few pints of normal saline with 5% glucose. Nausea and abdominal discomfort, persisting during the icteric stage, were sometimes troublesome symptoms. Some degree of relief was obtained by the use of sodium taurocholate, 4 to 6 gr. in cachets. Alkaline powder was also useful. Calcium lactate is indicated in unusually prolonged cases. The majority of cases require a spell of convalescence: alcohol should be forbidden during this period.

Summary and Conclusions

A short clinical description of 168 cases of infective hepatitis is given. Two fairly distinct types of onset are recognized and described. It is emphasized that the subsequent clinical course is almost identical in the two types.

The average duration of icterus was 24 days; the icteric stage lasted from 15 to 35 days in just over two-thirds.

The liver was palpable in 50% of cases and the spleen in 10%. Gross hepatomegaly was associated with prolonged jaundice, and the larger the liver the longer was the duration of icterus.

The diagnosis in the pre-icteric stage is often difficult, and in many cases will remain uncertain until bile pigment appears in the urine.

Hippuric acid tests for liver function by the oral method were performed in 14 cases when icterus was at about its height during the first three weeks of jaundice. Evidence of impaired function was found in all cases.

Recovery of liver function (as measured by the hippuric acid test) appears to be slow in some cases. In the convalescent stage of the illness, when icterus had just disappeared from the skin but remained in the sclerotics, evidence of liver insufficiency was demonstrated in 19 (65%) of the 29 cases tested. Impairment of liver function in the convalescent stage occurred in mild, average, and severe cases, and bore no constant relation to the presence or absence of hepatomegaly.

Evidence of liver insufficiency after total disappearance of jaundice was demonstrated in 4 cases.

Six cases with a history of one or more previous attacks of the disease are mentioned. Second attacks appear to be no worse than the first. The results of hippuric acid tests performed in 4 cases showed little or no evidence of residual liver insufficiency.

I wish to thank Col. H. D. F. Brand for permission to publish these cases, and Capt. A. D. Morgan, R.A.M.C., for help with the hippuric acid tests.

THE SIGNIFICANCE OF BLOOD-PRESSURE READINGS IN GENERAL SURGICAL WORK WITH SPECIAL REFERENCE TO THE CARDIAC INDEX

BY:

HAROLD DODD, Ch.M., F.R.C.S.

Surgeon to King George Hospital, Ilford, and to the Royal Hospital, Richmond; E.M.S. Surgeon to the London Homoeopathic Hospital.

Blood-pressure readings have been made before, during, and after general surgical operations in my practice since 1932. They have proved to be valuable and instructive. They were started with the need to detect and counteract the marked falls of blood pressure that occurred during spinal anaesthesia, and were used in the search for further aids in the detection of poor surgical risks with a view to excluding the necessity for the explanation "the operation was successful, but unfortunately the patient died" (Dodd, 1940). This note attempts to assess the significance of blood-pressure readings in general surgical work in the light of this experience.

Before Operations

The Cardiac Index.—It was from Mr. Ernest Miles that the significance of the Moot-McKesson cardiac index was learned. This estimation is more widely known than formerly, but it is seldom taught, and, because of this, when it is mentioned it meets with some scepticism. The cardiac index is estimated as follows:

The normal systolic blood pressure is 120 mm. Hg and diastolic 80 mm. Hg, the difference—the pulse pressure—being 40 mm. The cardiac index is reckoned by working out the percentage fraction which results by placing the pulse pressure as numerator over the diastolic pressure as denominator. Ordinarily the pulse pressure is 40 and the diastolic pressure 80, giving a fraction of $\frac{40}{80} = 50\%$.

The Significance of the Cardiac Index.—Clinical experience has shown that patients with a cardiac index between 33 and 80% are fair surgical risks, between 80 and 100% and between 25 and 33% they are doubtful and poor operative risks, while above 100 and below 25% no surgical procedure is safe: Miles said that opening a whitlow in such a patient is likely to prove fatal. This cardiac index has proved of assistance in the selection of patients for operation, and also after operations, when the blood pressure has been measured and serious disturbances found. It indicates the need for measures to improve the tone and fill the cardiovascular system—necessities that might otherwise be overshadowed by the problem of surgical diagnosis and the operation. Clinical improvement almost invariably follows these remedies, especially in elderly people, in whom the blood pressure is often around 140/70, giving a cardiac index of 100%. Pre-operative rest in bed for one, two, or three weeks, with a fluid intake of 6 to 8 pints daily and cardiac tonics, approximates these figures to, say, 130/80, and major operations have then been undertaken with consistently uneventful convalescences.

The opinion at present held as a result of these studies is that the blood-pressure figures in themselves mean little; it is the relation of the diastolic and systolic which matters—i.e., the cardiac index: a high or a low systolic blood pressure between 100 and 200 mm. is immaterial to the surgeon considering a major operation so long as the cardiac index is around 50%. Actually, in a period of ten years, during which the blood pressure of all new surgical out-patients has been taken, a systolic pressure of over 180 or lower than 100 has been rare in adults.

Condition of Heart and Blood Vessels

The taking of the blood pressure, apart from yielding the systolic, diastolic, and cardiac index values, gives good data concerning the regularity or otherwise of the heart-beats and, by the strength of the beat, the quantity of the heart output. These features, when noted with the stethoscope over the artery at the elbow, arrest the observer's attention more certainly than the routine clinical examination of the heart and pulse. Considerable variations in regularity and size of the pulse are detected, and the systolic and diastolic readings also sometimes

P. Freud, G. D. Rook, and S. Gurian (*Amer. J. Dis. Child.*, 1942, 64, 395), who report a case in a female infant aged 3 days, state that there are only five cases on record of herpes zoster in the newborn. Trauma and toxins could be excluded, so that an infectious origin was very probable. As in the other cases of herpes zoster in infants, evidence of pain and discomfort was absent. Complete healing took place in six weeks and there was no scarring.

vary from hour to hour and from day to day, denoting cardiac and vasomotor instability.

Sometimes when the diastolic pressure is being read it will be found that the arterial murmur continues until the pressure in the armlet is zero; this is interpreted as denoting aortic incompetence or a sclerotic or spastic artery, which is a further factor for consideration by the surgeon in a contemplated major operation on an elderly subject.

Illustrative Cases

Case 1: Coronary Thrombosis, ? Acute Abdomen.—A man aged 44 was admitted with an acute abdomen; the diagnosis was obscure: ? an acute gall-bladder, ? an acute appendix, ? an acute pancreatitis—certainly something "unusual." He was a stout, plethoric person. The blood pressure was 140/70, giving a cardiac index of 100%. In view of the uncertain diagnosis and the cardiac inefficiency, no immediate operation was proposed. The next day the picture was still confused; the blood pressure was 100/80, and a coronary thrombosis was considered. Operation was out of the question. Dr. Geoffrey Bourne agreed with the cardiac diagnosis. After a stormy period the patient recovered.

Case 2: Heart Efficient; Gangrenous Cholecystitis.—A man aged 69 was seen with apparently acute cholecystitis and colic. Five years before a partial gastrectomy for cancer of the stomach had been performed. The question was, "Was this a case of gall-stones or a metastasis obstructing the biliary apparatus?" He was in good condition; the blood pressure was 140/85 (cardiac index 64%). Operation was performed forthwith, and a gangrenous gall-bladder obstructed by a stone removed. He made an uneventful recovery.

Case 3: Auricular Fibrillation; Gall-stone Colic.—A woman of 67 was admitted with acute gall-stone colic. The question of immediate operation was excluded when the blood pressure revealed a fibrillating heart and figures of 140/60, giving a cardiac index of 133%. The patient was rested for four weeks. The blood pressure improved to 135/80 (cardiac index 68.75%), and a large stone was removed from the common bile duct. Although the operation was done under a local anaesthetic she had a stormy convalescence with four days of persecution delirium, and the fibrillation returned, but ultimately she recovered.

Case 4: Auricular Fibrillation, Gall-stones, and Jaundice.—A business man of 65 had had gall-stone colic and jaundice shortly before being seen. Operation was needed. His blood pressure was 120/50 (cardiac index 140%). The pulse was irregularly irregular, and there was considerable variation of the output at each systole. The heart was fibrillating. Rest in bed for nearly three weeks restored regularity, and the pressure improved to 140/80. Cholecystectomy and exploration of the common bile duct were performed. Convalescence was uneventful, and in spite of strenuous work (iron and steel trade) no further cardiac irregularity has been noted in five years.

Case 5: Diabetic Gangrene.—A woman with diabetic gangrene of the foot, and a blood pressure of 110/50 (cardiac index 120%), was undergoing amputation above the knee under open ether anaesthesia. She died on the table.

Case 6: Diabetic Gangrene.—A physician friend, J. B., related the following: A patient had diabetic gangrene of the foot. Immediate amputation was advised. The relatives asked for a physician's opinion. "My intuition," he said, "was that she was not fit enough then for the operation, but I could find nothing definite to back up my feeling, when I remembered the cardiac index. The blood pressure was 120/55, giving an index of well over 100%. I explained this to the doctor and surgeon, and they agreed to the delay. And she hasn't died," he concluded.

Case 7: Carcinoma of Stomach.—A man aged 66 was seen in consultation for indigestion which was clearly due to carcinoma of stomach. He looked reasonably well, and energetically discussed operation, its cost, time, place, etc. His blood pressure was 140/70 in the left arm and 70/60 in the right. I was puzzled as to the significance of this finding in an apparently fairly normal man. The usual pre-operative rest, transfusion, fluids, etc., were devised. He died suddenly that night.

Case 8: Varicose Veins.—A busy housewife had gross varicose veins. The operation of ligature and injection was advised. Her blood pressure was 140/70. She was rested two days, but it remained 140/70-80, giving a cardiac index of about 100%. Circumstances pressed for early operation, and as the procedure was small and was to be done under a local anaesthetic it was performed, although with uneasiness concerning the cardiac efficiency. She ran a high temperature after operation, and the pyrexia continued for several weeks, with malaise and a small pulmonary embolism as indicated by pain, cough, and blood-stained sputum.

Such has been our unsatisfactory post-operative experience when the cardiac index was less than 33 and over 85%: some complication develops—e.g., abdominal distension, chestiness, pulmonary embolism, delirium, strangeness of manner,

or sepsis. When the fundamental cardiac weakness is recognized and is treated by pre-operative rest in bed, a fluid intake of 5 to 6 pints daily, and gentle cardiac tonics—given orally, seldom by injection—these incidents are avoided. When the cardiac defect is found after the operation, then attention is focused on the cardiac and vasomotor condition, while local treatment to the operation area—e.g., meteorism—becomes a secondary consideration. Heart stimulants are given orally, not by injection, to feeble and aged subjects, because in the early days of this study two patients (aged 65 and 67) with carcinoma of the stomach who were being prepared for operation with nikethamide (coramine) 1 c.cm. subcutaneously t.d.s. died suddenly from cerebral embolism. It was considered that a thrombus had passed out of the left auricular appendage into the systemic circulation.

Blood-pressure Readings During Operations

The Anaesthetic.—By taking the blood pressure every five minutes during operations surprising falls and variations have been found, irrespective of the type of procedure, whether major or minor. They occur with all sorts of anaesthesia—a statement based on thousands of readings during the period 1933-43 (Dodd, 1940). The variations in pressure are wide during spinal anaesthesia, somewhat less with general anaesthetics, and much less with local infiltration of novocain or amethocaine hydrochloride (decicain). The progress of the blood pressure is unpredictable. A severe fall in blood pressure is not regarded as an indication of shock, but, taken with other factors, it is helpful.

Blood-pressure-raising Agents.—Remedies directed to the restoration and maintenance of the blood pressure around normal have lessened the post-operative morbidity and also the mortality. Certain drugs have been proved as pressor agents, particularly pholedrine (Dodd, 1942) and methedrine (Dodd and Prescott, 1943), and 30% hypertonic saline 20 to 40 c.cm. (Walker, 1936). Cardiac tonics such as nikethamide, leptazol (cardiazol), digitalis, strychnine, etc., have no pressor effect, while by contrast that of adrenaline and icoral is too violent for clinical use.

Position of Patient on Operating Table.—This affects the blood pressure. When the bridge of the operating table is raised for gall-bladder and kidney procedures a steady fall in pressure ensues, but with the lowering of the bridge the blood pressure recovers. This bridge is painful to patients: pneumatic pillows are more comfortable. Sudden changes from the Trendelenburg to the horizontal position also cause falls in pressure; lifting from the table to the ambulance and thence to the bed is also associated with a fall, which is considerable and recovers but slowly after major procedures.

The Operative Procedure.—Exploration of the abdomen and palpation of the common bile duct are nearly always followed by a fall in blood pressure, and in some cases with weakening and temporary irregularity of the pulse. With a well-planned local and regional infiltration this is largely eliminated. Pulling on the mesenteries or parietal peritoneum to close the abdomen causes a similar fall, as also does packing the intestines into the abdomen. Manipulation of the renal pedicle affects the pressure adversely, while in a radical breast operation the pressure is continuously low, with limited response to the usual dose of pressor drug.

Pentothal during Operation.—The interesting fact was noted that if pentothal in 5-10% solutions (say, 3-5 c.cm.) is injected quickly a prompt fall in blood pressure occurs, which gradually recovers as the respirations strengthen. The safe rate of injection is 1 c.cm. per half-minute.

Death on the Table.—Death on the operating table is an abrupt shock to a surgical team. Only one death has occurred on the table (from a ruptured thoracic aneurysm) when pressure observations were being made. One assistant said that patients "never look like dying" when such readings, and the necessary corrections, are made. With regard to conventional operations without pressure observations, there readily come to mind three deaths on the operating table which were first detected by the surgeon.

Post-operative

Choice of the Remedy in Collapse.—Taking the blood pressure gives an indication of the remedy required by a patient. Thus

a man may be cold and somewhat cyanosed, with a weak pulse, yet the blood pressure be within normal limits. This patient's need is a cardiac tonic such as nikethamide plus oxygen. On the other hand, the pulse may feel average but the blood pressure is below 80 mm. Hg; here a pressor agent is required. Observers who have taken thousands of pressure readings constantly report such findings, and also their inability to estimate the blood pressure by palpating the pulse.

A male, 24 hours after a three-quarter partial gastrectomy for a large gastric ulcer and a duodenal ulcer, collapsed and became unconscious. His respirations were 48 and forcible, the pulse was 160, but the heart-beat was regular and sounded strong at the apex. The blood pressure was 80/60 (cardiac index 33%) and his nails were white. In this case oxygen and a pressor agent to restore the blood pressure were necessary. Both were given, and in five minutes consciousness was regained and recovery followed. The conventional cardiac tonic would probably have been ineffective.

Another finding is that of simultaneous cardiac and pressure weakness or failure. The pulse is feeble and irregular and the pressure low. A combination of nikethamide or leptazol 1 c.cm. and pholedrine 1 c.cm., given together intramuscularly, yields a powerful effect.

Fluid Loss.—Should there have been a considerable loss of fluid, as after gross injuries or extensive operation, then an infusion of blood or plasma is necessary to fill up the circulatory system. Stimulants or saline will not act in this capacity; in fact, continuous saline is harmful to shocked patients because the body has no storage facilities for salt-and-water, which waterlogs the bases of the lungs.

Post-operative Observations.—Post-operative observations of the blood pressure are important after the use of spinal anaesthetics and after the shock-producing procedures. Low readings are found up to four days after operation. Response to pholedrine or methedrine or intravenous hypertonic saline is prompt.

Summary

The Moot-McKesson cardiac index is described and its value indicated in major operations.

Some factors affecting the blood pressure at operations are described.

After operations, the need to give primary attention to the cardiovascular system rather than to the operation area is emphasized.

The help available from blood-pressure readings in the choice of the correct remedy is described.

Continuous intravenous infusions of saline post-operatively in shocked patients are deprecated.

CONTINUOUS ADMINISTRATION OF INTRAVENOUS ANAESTHESIA

A SIMPLE METHOD

BY

F. W. ROBERTS, M.B., B.S., D.A.

Honorary Anaesthetist, the Middlesex Hospital

AND

B. A. SELICK, M.B., B.S., D.A.

Senior Resident Anaesthetist, the Middlesex Hospital

In view of the increasing popularity of intravenous anaesthesia and the growing number and complexity of devices (Semans, 1941) for its administration, we would like to place on record a method which we have been using at the Middlesex Hospital for more than two years. It is simple to carry out, gives accuracy of dosage, and is economical in materials.

The Apparatus

This is a positive-pressure drip saline infusion apparatus (Fig. 1), consisting of a saline reservoir, drip-bulb and tubing, glass aspiration indicator, needle, and a means of providing positive pressure.

1. **Pressure.**—This is provided as follows: (a) By a hand bulb—e.g., of a sphygmomanometer or Higginson's syringe. A clip is often needed to prevent leakage back through imperfect valves. (b) By an oxygen cylinder. A Y-tube is connected in the tubing

from the reducing-valve of an oxygen cylinder to the flowmeter. The remaining arm of the "Y" is joined to the shorter tube of the saline reservoir. By restricting the flow from, say, 4 litres a minute to 2 litres, by means of a screw-clip on the tubing which

FIG. 1

leads to the flowmeter, enough pressure is built up to drive over the saline (Fig. 2). The 2 litres a minute from the flowmeter can be administered to the patient via a nasal catheter, B.L.B. mask, or in combination with nitrous oxide from a Boyle machine.

FIG. 2

2. **Saline Reservoir and Rubber Stopper.**—(a) The Baxter vacoliter screw-topped saline-bottle has the advantage that it is squat and not easily overturned, and the screw top cannot be blown off. (b) Any bottle in which sterile saline for intravenous use is supplied can readily be adapted by fitting a suitable-sized rubber stopper with two holes through it. Two tubes—metal, to prevent breakage—are pushed through the rubber stopper. One of these reaches almost to the bottom of the container; the other ends above the surface of the saline.

3. **Drip-bulb.**—A Murphy or similar drip-bulb is attached to the longer of the two tubes by rubber tubing; a clip on this regulates the flow of saline.

4. **Rubber Tubing.**—The latex type of tubing is the most satisfactory, as air bubbles can be seen through it.

5. **Glass Connexion.**—Apart from joining the latex tubing to the pressure tubing, this will show if blood had diffused back along the tube when the needle was introduced into the vein. If the connexion remains free of blood, only that part of the apparatus distal to it need be sterilized or changed between cases.

6. **Pressure Tubing.**—This is used as it withstands repeated needle puncture without leaking. It should be about 4 to 6 in. in length.

7. **Aspiration Indicator.***—This is a short straight glass tube with a small bulb blown in its centre. There are two metal mounts—one to fit a needle, and the other to fit a Record syringe. The indicator can first be used between syringe and needle (Fig. 3) when

FIG. 3

the induction dose is given. The aspiration test of the position of the needle can be performed without contaminating the syringe with blood. The indicator is then removed and fitted between the pressure tubing and a larger needle.

8. **Needle.**—A short-bevel size 1 (Record) about 1½ in. long is quite large enough (equivalent to about 4 or 5 serum needle).

9. **Arm Splint.**—A piece of wood about 4 in. by 1½ in. by 4 ft. is padded for half its length. Two domette "tails" are attached to the padding to fix the arm in place.

10. **Tourniquet and adhesive tape** are also required.

Technique

Pressure is raised in the saline reservoir and the regulating clip opened, allowing saline to flow until all air bubbles are removed. The clip is closed, and the level in the drip-bulb is adjusted by the clip on the side tube. The patient is then induced, using up to 0.5 g. of 5% pentothal solution in a 10-c.cm. syringe. For ease of venepuncture and the patient's comfort use the aspiration indicator and a fine needle (Vann Bros.' "evipan" size) (Fig. 3). The

* Also known as "varicose vein mount": obtainable from John Bell and Croyden Ltd.

patency of the airway is maintained by positioning of the patient's head or by the insertion of a soft rubber oral airway (Guedel type); or a short nasopharyngeal tube is passed through the nose. We have found it beneficial to employ supplementary nitrous-oxide-oxygen anaesthesia (see below).

The patient is now transferred to any desired position on the operating table, and one arm is firmly bound to a splint, the unpadded end of which is inserted beneath his shoulder. The tourniquet is applied and the needle inserted into a suitable vein. With the drip turned off, the venous congestion produced by the tourniquet causes blood to diffuse back into the indicator—proof of the intravenous position of the needle. The drip is now started (40 to 50 drops a minute), and the needle is fixed in position by adhesive tape. We have found that the needle is held more securely and lateral movement prevented if a small piece (1 in. by 1½ in.) of tape is placed beneath the needle with the adhesive side uppermost. Two longer pieces are then applied over both needle and tape, securing them to the surrounding skin (Fig. 4).

FIG. 4

Further injections of 5% solution of pentothal are made, as required, by syringe and needle into the pressure tubing, which should be pinched on the drip-bulb side during the injection to prevent "backwash" and consequent delay in the passage of the drug to the patient.

Advantages

Positive-pressure drip apparatus eliminates the cumbersome unstable stand required by gravity drips, and as the saline reservoir can be placed quite near the vein, long lengths of tubing are avoided.

The glass aspiration indicator facilitates venepuncture.

Should the needle become dislodged between the injections of pentothal, saline only will be introduced into the subcutaneous tissues. In other methods (Rivett and Quayle, 1940; Macintosh and Pask, 1941) irritant pentothal may so escape.

Accurate doses of pentothal can easily be injected and their full effect quickly assessed. The same concentration of the drug (5%) is used throughout, thus avoiding error due to different solutions.

The absence of Y-tubes joining separate containers of saline and pentothal (Rivett and Quayle, 1940; Thomas, 1942), syringes, multi-directional taps (Rivett and Quayle, 1940; Semans, 1941), and numerous lengths of tubing lessens the weight attached to the arm and hence there is less likelihood of the needle becoming dislodged. More important is the lack of "dead space" (Adams, 1941) in the apparatus we describe; hence there is minimal delay in action of the drug due to "backwash" and uncontrollable dilution.

Supplementary Anaesthesia or Oxygen

Organe and Broad (1938) reported a series of cases in which supplementary nitrous-oxide-oxygen anaesthesia was used. Various writers have advocated supplementary oxygen (Carraway, 1939; Carraway, C. N., and Davison, T. C. (1941). *West. J. Surg.*, 49, 514. Davison, T. C. (1943). *Anesth. & Analges.*, 22, 52. Macintosh, R. R., and Pask, E. A. (1941). *Lancet*, 2, 10. Organe, G., and Broad, R. J. B. (1938). *Ibid.*, 2, 1170. Rivett, L. C., and Quayle, G. (1940). *Proc. roy. Soc. Med.*, 33, 631. Semans, J. H. (1941). *J. Urol.*, 45, 249. Thomas, G. J. (1942). *Pennsyl. med. J.*, 45, 467.

views we have found that supplementary nitrous-oxide-oxygen anaesthesia is of value because: (1) The total dosage of pentothal required is considerably smaller, hence the degree and duration of post-operative respiratory depression are reduced to a minimum. (2) A continuous visual indication of the patency of the airway and the volume of respiratory exchange is provided by the movements of the rebreathing-bag. (3) The percentage of oxygen can be increased greatly in excess of that found in atmospheric air, thus overcoming anoxia due to shallow respiration. (4) Rhythmical pressure on a rebreathing-bag filled with oxygen provides the most efficient form of artificial respiration should apnoea occur.

A FATAL CASE OF CEREBRAL MALARIA

BY

I. B. SNEDDON, M.B., Ch.B., M.R.C.P.

Surg. Lieut., R.N.V.R.

(From a Naval Hospital)

Cerebral malaria is a rare cause of coma in this country, but with the return of large bodies of our troops from areas where subtertian malaria is endemic this complication may be seen more frequently. It is a medical emergency which often responds well to early treatment, but its gravity can be judged by the mortality of 40% recorded by Sandford, Crawford, and Warr (1940) in a series of 48 cases. The following description of a fatal case is presented as a reminder that malaria should be considered in the differential diagnosis of coma and that unless treatment is started early, gross irreversible pathological changes occur in the brain.

Case History

On Sept. 2, 1942, a 28-year-old stoker was admitted to a naval hospital in a semi-comatose state, having been sent from a destroyer whose previous travels were not divulged. He had been suffering from a severe headache for three days, but had not reported it as he had not wanted to miss going on leave. On the morning of admission he had reported sick, complaining of a severe headache, frequent vomiting, and fever. No abnormal physical signs had been found by the medical officer of the destroyer. The patient had lapsed into a semi-comatose state during his journey from the ship to hospital.

On examination he was found to be semi-comatose, but was easily aroused by a loud voice or a pin-prick; he was not able to speak and was incontinent of urine. T. 103, P. 120, R. 28. The skin was dry and muddy-coloured but burning hot. The teeth were tightly clenched. The pupils were contracted and slightly irregular, and reacted sluggishly to light; the fundi showed no abnormality. There was no paralysis of the limbs, and the muscle tone was normal. The deep reflexes were all present, but were sluggish. Abdominal reflexes were present. Plantar responses were flexor. There was no neck rigidity or positive Kernig's sign. A few moist sounds were heard at the base of the right lung. Heart sounds were normal. B.J. 110/70. The abdomen showed no rigidity and the liver and spleen were not palpable.

In view of the possibility that he might have a meningococcal septicaemia he was given 1 g. of sulphapyridine intramuscularly while the following investigations were being carried out:

Urine: Specific gravity 1014, acid; a heavy cloud of albumin blood-positive chemically, numerous red blood corpuscles and granular casts seen. **Blood:** Urea, 42.1 mg. per 100 c.cm.; sugar 85 mg. per 100 c.cm.; leucocyte count, 14,200 per c.mm. (poly morphonuclears 77%, lymphocytes 12%, large mononuclears 11%) C.S.F.: Lumbar puncture revealed clear fluid under normal pressure containing 3 cells per c.mm., no excess of globulin, 50 mg. of protein and 92.8 mg. of sugar per 100 c.cm.

In view of the negative findings it was thought that the diagnosis lay between septicaemia and cerebral malaria. Blood films were therefore taken; numerous ring forms of *Plasmodium falciparum* were found, but no crescents. An intravenous 5% glucose-saline drip was started immediately. 10 gr. of quinine dihydrochloride together with 10 min. of 1/1000 adrenaline hydrochloride was dissolved in 20 c.cm. of water and given slowly by a hypodermic syringe into the rubber tubing of the drip apparatus. The intravenous glucose-saline was continued throughout the night, and on the morning of Sept. 3 the patient was fully conscious and able to recognize his relatives. His general condition seemed much improved (T. 99.2° P. 100), but persistent vomiting prevented the administration of fluids by mouth. A further dose of 10 gr. of quinine dihydrochloride was given in the same manner as before. His condition continued to improve during the day. A blood count showed 4,400,000 red cells per c.mm.; haemoglobin 100% (Haldane); and 18,000 leucocytes per c.mm. On Sept. 4 his temperature rose to 104°; his appearance was more icteric, and he again lapsed into coma. Lumbar puncture was repeated and 10 c.cm. of clear fluid was removed. 10 gr. of quinine was given intravenously and a slow-drip blood transfusion was started. No improvement resulted from these measures, and by the morning of Sept. 5 his condition had greatly deteriorated. The blood urea was 118 mg. per 100 c.cm. His temperature had risen to 105°, and despite frequent tepid sponging it remained between 104° and 105° until death occurred on Sept. 6.

At necropsy the salient features were as follows. Brain: Congestion of the vessels on the surface of the cerebral hemispheres; numerous petechial haemorrhages present throughout the brain, but more so in the cerebral hemispheres than in the brain-stem. Spleen: Enlarged to twice normal size, dark, soft, and flabby; pulp purplish

ey in colour, with a semi-fluid consistency and general loss of ructure. The liver was also enlarged, and showed a purplish-grey able cut surface. Hypostatic congestion was present at the bases both lungs.

Dr. W. W. Woods, Consultant Pathologist to the Navy, reported sections of the brain, spleen, liver, and kidney as follows:

"In the two pieces of brain many of the capillaries contain numerous minute nodules of pigment which is negative to Perles's test for iron; this is in keeping with its being malarial pigment. Further, the general configuration of the numerous well-defined dots of pigment is strongly suggestive of malaria. Some of the pigment appears to be in red blood corpuscles, where it ought to be, but much of it seems to lie free in the lumen of the capillaries, perhaps because the corpuscles containing it are very indistinct. Also, I found it impossible to stain the bodies of the parasites themselves, in which the pigment is presumably contained; in a very few instances I thought I could see the faintly stained body of the parasite around a dot of pigment. I can only presume that this failure to demonstrate the parasites is due to post-mortem degeneration or poor fixation, or both. In the white matter of the piece of cerebrum there are numerous petechial haemorrhages, some of them obviously perivascular and some of them ring-haemorrhages; there are very few in the grey matter and a considerable number in the more heavily myelinated part of the other piece of brain, whose site I fail to recognize. In spite of the failure to show the bodies of the parasites, I think there can be no doubt but that this is a specimen of cerebral malaria.

"There is abundant pigment in the spleen and—which I think is more significant—it is abundant in the Kupffer cells in the liver and in the sinusoids, and is negative to the test for iron. There is very little pigment in the glomeruli of the kidney. I could not see any actual parasites in these three tissues."

Commentary

Lack of knowledge of the movements of the man's ship added to the difficulty of diagnosis in this case. It was afterwards ascertained that he had been in Sierra Leone two weeks before he was taken ill. The diagnosis was reached largely by exclusion, but on reviewing the presenting symptoms and signs they do fit in well with those of other cases which have been described. The comatose state with no abnormal signs in the central nervous system, the muddy sallow complexion, the moderate leucocytosis with a raised monocyte count, are all commented on by Sandford, Crawford, and Warr (1940). In the present case one striking feature was the in-point pupils.

Differential Diagnosis.—The differential diagnosis includes, of course, all the causes of coma, but those particularly apt to cause difficulty are:

1. **Alcoholism.** The drowsy irrational state with slurred speech usual in the early stage of cerebral malaria is very suggestive of alcoholism, as has been noted by Minett and Bernfield (1937).
2. **Meningitis,** in particular the fulminating meningococcal infections, may also be simulated. Wright (1941) stresses the fact that lumbar puncture should be carried out in every case, as cerebral malaria may cause neck rigidity, and the finding of *P. falciparum* in the blood does not exclude a coincident meningitis.
3. **Cerebral haemorrhage, thrombosis, or embolism** may also be simulated by cerebral malaria. Embolic phenomena may be produced by malarial parasites.

The conclusive proof of the diagnosis in this country is the finding of *P. falciparum* in the blood. Usually an infection severe enough to cause coma is a heavy one, and a blood slide will show numerous parasites. A few cases, in particular those with an embolic onset, may have only a light infection, and parasites in the peripheral blood may be difficult to find.

Treatment.—Treatment should not be delayed while further diagnostic procedures such as sternal puncture are carried out. If the history and physical signs are suggestive quinine should be given at once. This may be a life-saving measure, and is helpful in diagnosis if a favourable response is obtained.

The fatal outcome in this case was disappointing, particularly after the dramatic response to quinine in the first 24 hours. However, it serves to impress the fact that if treatment is to be successful it must be prompt. The delay in treating the malarial infection before the complication of coma supervened was due to the patient's own foolishness in concealing his illness: in most cases malaria should be diagnosed and treated before pernicious complications occur. In this case quinine dihydrochloride was administered solely by the intravenous route. The dosage used—i.e., 10 gr. daily—was higher than

the 5 to 7 gr. advocated by Manson-Bahr (1942). No toxic reactions were seen that could be attributed to the intravenous quinine, but care was taken to give it slowly through a hypodermic needle into the intravenous drip apparatus. Adrenaline hydrochloride, 10 min. of 1/1000 solution, was always given at the same time. Intramuscular quinine is advocated in these cases by Wright (1941), but he does not give any reason for avoiding intravenous injection. Fawcitt and Walters (1941) recommend a transfusion of reconstituted blood serum as a detoxicating and stimulant measure, and Manson-Bahr (1940) recommends blood transfusion if there has been great blood destruction. Lumbar puncture, with removal of 10 c.cm. of cerebrospinal fluid, had no effect in relieving the coma in the late stages of this case, but in view of the marked pathological lesions of the brain found at necropsy this is not surprising.

I wish to express my thanks to the Senior Medical Officer of this hospital for permission to publish the case, and to Dr. W. W. Woods, Consultant Pathologist to the Navy, for his report on the pathological sections.

Medical Memoranda

Suppurative Mastoiditis in an Infant

I have been much impressed by Mr. P. W. Leathart's paper entitled "A Common Cause of Diarrhoea, Vomiting, and Dehydration in Infants" (Aug. 7, p. 168). It struck me as having been based on sound reasoning and wide experience in a field apparently little recognized, but one of considerable importance. Although parenteral infection is universally known to be an important cause of "D. and V." in infants, only too often it gives place to the diagnosis of gastro-enteritis after the more easily detectable and better-known sites of infection have been excluded. I would like to cite the case of an infant recently admitted to the Southend General Hospital. Besides being a practical example of the point made above, this case tests the truth of most of the criteria laid down by Mr. Leathart for enabling a diagnosis of suppurative mastoiditis to be reached in the ward instead of in the post-mortem room. It is to be regretted that the diagnosis suspected in this patient had to be confirmed in the latter situation instead of on the operating-table. It may be hoped, however, that the lesson learned has helped to offset a fatal end-result.

HISTORY OF CASE

The baby was first seen on July 27, 1943, with a history of vomiting after feeds since birth. Apart from rapid delivery, the previous history was negative. His birth weight was 6½ lb. and he was breast-fed. Stools were "loose" but otherwise normal. Examination revealed a healthy infant, weighing 7 lb. 14 oz. No abdominal mass was felt, nor was peristalsis seen. He was admitted for observation and weaning, and was discharged a fortnight later, having gained 1 lb. and having been taking five milk feeds daily without vomiting.

He was readmitted on Oct. 30, aged 4½ months. The mother stated that for one week he had vomited after every feed, that he "pumped it up," and that much clot was present in the vomit. As previously, examination was entirely negative. He looked a healthy, well-developed infant, and weighed 12 lb. 14 oz. He fed eagerly, even greedily, and was given boiled water and chloral before feeds. Vomiting was completely controlled after five days, while weight was gained after a small initial drop. During this time the stools remained normal in frequency and colour. Nov. 6: Weight 13 lb. 1 oz., feeding well but greedily. Nov. 11: Pyrexia (100° F.) noted: stools, though not frequent, were green, and vomiting occurred once; general condition good. From this time onward a remittent temperature of 102.4° was maintained; stools were frequent, green, and offensive (up to 7 in 24 hours), with occasional vomiting. The infant looked pale, but lay quietly and showed no signs of dehydration. Glucose-saline was given by mouth combined with a course of succinyl-sulphathiazole.

Meanwhile investigations were carried out. Radiographs of chest, examinations, and culture of the urine were negative. Blood examination showed Hb 84%, W.B.C. 13,600, with 59% polymorphs. Culture of stools revealed no pathogenic organisms, except on the second occasion, three days before death, when a few colonies of *B. proteus* were found.

Nov. 18.—In spite of treatment, which included restriction of everything by mouth to boiled water, glucose-saline, and amino-acids (in the form of casein hydrolysate), a slow subcutaneous normal-saline drip, and two courses of succinyl-sulphathiazole, the little patient was obviously going downhill. On examination he lay quietly, with the head persistently turned to the left, so that a bald patch formed over the left parieto-occipital region. He was irritable, and any examination caused him to cry, but light pressure over either mastoid was not especially resented. The right ear was noted to be pushed forward as compared with the left, but the surrounding skin was neither red nor oedematous.

Three observers, including a surgeon, who examined the drums, pronounced them normal. At no time was any discharge seen. The glands in the right posterior triangle were found to be palpable, in contrast to the left, but were not greatly enlarged or tender. The diagnosis of bilateral suppurative mastoiditis was considered, but the paucity of localizing signs did not seem to merit surgical intervention. Conservative treatment was continued. The patient went steadily downhill, and died on Nov. 25.

Necropsy revealed extensive bilateral suppurative mastoiditis, more marked on the right side. The alimentary tract, apart from distension of the small intestine, appeared normal. There was no injection of the mucous membrane or prominence of Peyer's patches. The lungs were congested and oedematous. The meninges and superficial cerebral vessels showed considerable congestion. Dehydration was not a prominent feature.

COMMENTARY

It is felt that had bilateral mastoidectomy been undertaken the infant's life would probably have been saved. The reasons for making this statement and the salient features of the case may thus be summarized: (1) A healthy infant who is a greedy feeder vomits as a result of the latter. Vomiting takes place in the horizontal position, and this, plus the manner of feeding, invites entrance of vomit and milk into the Eustachian tubes. (2) For no apparent reason remittent pyrexia, diarrhoea, and vomiting make their appearance. (3) Investigations prove negative, and there is no response to treatment, including chemotherapy. (4) A bald patch forms on the left side, while the right ear is pressed forward as compared with the left, and the glands in the right posterior triangle are found to be enlarged. (5) A steady downhill course ensues, ending fatally, with post-mortem findings of extensive bilateral suppurative mastoiditis.

I wish to thank Dr. R. Sleight Johnson for his permission to publish this case.

D. S. LEWES, B.M., M.R.C.P.
Medical Registrar, Southend General Hospital.

Sulphathiazole Insufflations as a Treatment of Gonococcal Vaginitis

Under present war conditions any method which promises well in the treatment of gonococcal lesions in the female should be made known without the customary prolonged and exhaustive private investigation. No claims are made, no conclusions or apologies offered, and no recriminations will be necessary if yet another treatment eventually proves ineffective.

There is nothing new about the treatment of gonococcal lesions in the female by sulphapyridine, sulphathiazole, and allied preparations as given orally. The results are not well known, but in many instances are disappointing. The chronic cases seem particularly resistant. The insufflation of "picragol" powder into the vagina for trichomonad infestations has been established, and is widely known. The combination of insufflation with sulphathiazole powder does not seem to have been suggested to date. My own experience with sulphathiazole insufflations in the gynaecological out-patient department of Sir Patrick Dun's Hospital, Dublin, in cases of chronic and subacute gonococcal vaginitis and endocervicitis, has been so dramatic that I draw attention to it so that others may, if they approve, put the plan to the test.

The treatment consists of the bi-weekly insufflation of 5 to 7 g. powdered sulphathiazole with a "picragol" insufflation apparatus and following the directions for its use. No oral chemotherapy or other treatment has been employed at the same time. In brief, the cases treated have been those of the troublesome subacute and chronic proved gonococcal variety which have defied every usual remedy. In each case three insufflations, as described, have caused almost complete cessation of all discharge and soreness. Such slight discharge as may then still be present is clear and would be regarded as normal but for the previous knowledge of the case.

This result seems too good to be true, and may be so. The truth or otherwise of the early results can be readily and simply put to the test. The principles on which the treatment, if successful, would depend are well known and need no explanation here.

O'DONEL BROWNE, F.R.C.P.I., F.R.C.O.G.
King's Professor of Midwifery, Trinity College, Dublin.

Reviews

MEDICAL MYCOLOGY

An Introduction to Medical Mycology. By George M. Lewis, M.D., and Mary E. Hopper, M.S. Second edition. (Pp. 342. \$6.50.) Chicago: The Year Book Publishers Inc., 1943.

In these days of authorized economy standards it is refreshing to meet with a volume in which the American skill in book production is allowed to have its head. The second edition of Lewis and Hopper's *Medical Mycology* is well up to the usual transatlantic level. We are glad that, in spite of the seriousness of the times which weighed upon the authors when considering republication, they have seen their way to produce this delightful volume and to embellishing it with two excellent coloured plates, which are a novel feature. As is customary in new editions, expansion has taken place and a few gaps in the original work have now been filled up.

It is beyond question that medical mycology grows in importance from year to year, and especially for the dermatologist. Perhaps the problem of greatest practical moment in the whole subject is that of epidermophytosis of the feet, popularly known as "athlete's foot." This no doubt is quite common, but during the last few years it has become fashionable to diagnose almost every inflammatory condition of the skin of the toes and sole under this label without any pathological proof, either from microscopical examination of the tissue or from cultural tests, of the presence of the dermatophyton. For this reason vast numbers of cases of simple dermatitis in these regions have been aggravated by the use of strong fungicides. We are glad to find that Drs. Lewis and Hopper are strongly of opinion that the diagnosis of epidermophytosis should never be made without laboratory confirmation. The same remarks apply, with even more force to the secondary eruptions which sometimes occur in conjunction with epidermophytosis and which are known as dermatophytids or trichophytids. They say that these are diagnosed much too often. The chapter on epidermophytosis deserves careful study by all practitioners, especially perhaps by the like the medical officers of the Forces, who have charge of large numbers of people living together in camps or institutions.

A new disease, which did not receive notice in the first edition is histoplasmosis. This is a rare but usually fatal disease that occurs in Central America, characterized by hepatosplenomegaly, and is interesting because clinically it resembles leishmaniasis. Histoplasmosis is also noteworthy because it appears to be only the second example of a fungoid infection which does not primarily affect the skin; the first one to be differentiated was the *Cryptococcus histolyticus*, which affects the nervous system. The recommendation made above, that medical men in general should study the chapter on athlete's foot, applies really in equal measure to the whole of this excellent volume.

GENETICS OF THE MOUSE

The Genetics of the Mouse. By Hans Grüneberg, Dr. Phil., Dr. Med. (Pp. 412; illustrated. 30s.) Cambridge: University Press, 1943.

In the field of genetics it is difficult to draw a line between pure and applied research. Small, cheap, rapidly reproducing animals present manifest advantages, and for many purposes must be the standard material of the investigator. But discoveries relating to larger animals may be no less fundamental, and research on any species, variety, or breed may on occasion contribute to the advancement of the subject as a whole. Man himself is not excluded. For example, more is known about geographical variations in the distribution of the blood-group genes than is known in the case of any other genes, whether plant or animal.

In this admirable book Dr. Grüneberg points out that, though the mouse is the best-investigated mammal, the omission of all results obtained from it would hardly affect the textbooks as

regards chromosome theory, population genetics, or evolution. But in developmental genetics, in physiological and pathological researches on the mode of action of genes, we should lose some of our best examples. This is the particular contribution of the mouse (though others must not be overlooked—for example, cancer studies and the genetics of resistance to infection). Large numbers of hereditary variations have been found, providing a rich field for the investigator, of whom one of the best known is Dr. Grüneberg himself.

The condition "myelencephalic blebs" may be chosen as one of many examples. A single gene is responsible for end-results which are highly diverse in kind and degree. It induces defects of the eyes ranging from slight atrophy of the eyelids to total disorganization with absence of the optic tract and involvement of the skull; foot anomalies, such as syndactyly, hypodactyly, polydactyly, and amputation; failure of hair growth in the saddle region. Extensive studies by several investigators, utilizing such techniques as the observation of the unharmed developing embryo through the transparent uterine wall, have elucidated much of the mechanism. Very briefly, a normal process, the oozing of cerebrospinal fluid through a temporary foramen in the fourth ventricle, is exaggerated. Blebs are produced which are guided by mechanical forces along the curvatures of the body to resting places where they are absorbed, usually after affecting organs which happen at the time to be differentiating in the neighbourhood. Modifying factors, known to be potent, act by determining the paths taken by the fluid.

It is clear that the pathologist is here presented with a fine field for study, and it is probable that in the future many a human problem can be illuminated by work on the mouse. We hope that this book will have a wide circulation. It is authoritative, well arranged, as clear as a complex subject permits, and an excellent guide to the literature. Apart from the difficulty of forgiving Dr. Grüneberg for the dreadful word "intrastomachal," it is hard to find anything to criticize. The illustrations are excellent, and the book is admirably produced.

HOME SECURITY

Fire Protection and A.R.P. Year-Book 1943-44. (Pp. 304. 7s. 6d., post free.) London: Lomax, Erskine and Co. Ltd.

Year-books mostly inspire a great respect for the profession or institution whose interests they serve, but this year-book does so in an exceptional degree. The whole subject is so new. It seems only yesterday that men were feverishly digging trenches in London squares by torchlight and trying out taxicabs converted into fire engines, and here the science of fire control and prevention is expounded in the most scientific and methodical manner. The compilation is indicative of the vigilance and high purpose of a service which has enlisted the enthusiastic co-operation of hundreds of thousands of people who had never expected to apply a first-aid dressing or to handle a rubber hose except for gardening. We may wonder whether the logarithmic equations given for such matters as the delivery of water in pipes or the velocity of bombs will mean very much to the average civil defence worker, but there is no end of information to be picked up—as, for example, that for complete protection against a one-ton bomb a thickness of 6 ft. 7 in. of reinforced concrete is necessary, and that for four houses well alight a thousand gallons of water a minute must be applied. One admires the N.F.S. and A.R.P. officers also for their absorbent capacity for regulations. A list is given of the statutory rules and orders covering, roughly speaking, A.R.P. since the war began. There are 240 of them, without counting those which have been revoked. The N.F.S. general regulations issued in 1941 have since been amended by twelve new sets of regulations. Standard specifications for A.R.P. equipment number 49.

This compact book contains a directory of N.F.S. and A.R.P. officers, maps of the fire regions, schedules of equipment for first-aid and rescue parties, an index of proprietary and trade names, a bibliography of war gases and decontamination, not to speak of a list of great fires since that of Alexandria, and a "perpetual" black-out calendar for this and subsequent years. The word "perpetual" has an ominous look, and we hope it will soon be proved a slip of the pen.

Notes on Books

MISS EVELYN C. PEARCE'S *Textbook of Orthopaedic Nursing* appeared first in 1927 with a foreword by Sir Robert Jones and an introductory chapter by Dame Agnes Hunt. In reviewing critically the second edition we said that the information given was accurate and up-to-date and that the book could be well described as "Elementary Orthopaedics for Nurses." For a third edition Miss Pearce has taken pains to preserve the simplicity of the original work, and has kept the emphasis, as hitherto, on the need for care and observation. The author has long been known as one of the most successful teachers in the nursing profession, and the new edition of this book with its excellent illustrations will no doubt make a wide appeal to the many women who intend to take up a branch of surgical nursing, which grows in importance every year. It is published by Faber and Faber at 8s. 6d.

The Industrial Health Research Board of the M.R.C. has issued as No. 1 of a popular series on Conditions for Industrial Health and Efficiency a pamphlet *Ventilation and Heating: Lighting and Seeing* (H.M. Stationery Office; 3d.). During the war there has been much evidence that the results of research into industrial health are not widely enough known and appreciated. This well-written and attractively produced pamphlet is not intended for experts, but has been compiled in order that the main facts discovered by research workers may become common knowledge to any interested person in industry, whether manager or worker. The Board proposes that in future the results of any important new research in industrial health shall be published both in a detailed scientific report and also in a short non-technical form in this series of pamphlets.

Preparations and Appliances

A NEW FORM OF SPLINT PADDING

Dr. W. O. SPENCE writes from the Salisbury General Infirmary:

Whether it be in the country practitioner's surgery or in a city ambulance's equipment very little attention seems to be given to the provision of adequate padding in the first-aid use of splints. Mr. Charles Harris, M.B.E., Commandant of the Wilts 5 Detachment of the British Red Cross Society, has made and patented a simple universal splint pad, constructed out of sponge rubber, on the lines illustrated in the diagram.

The chief advantages of this padding are as follows: (1) It is adaptable for use with any form of limb splint, whether of flat or "gutter" type; (2) it is rapidly secured in position by

FIG. 1.

FIG. 2.

rubber bands; (3) it moulds itself comfortably to the limb as the fixing bandages are tightened (unlike the padding so frequently seen sewn on to wooden splints presenting a convex surface to the limb); (4) it is very easily and quickly cleansed when stained with blood, etc.; (5) it can be used time and again without deteriorating.

For splinting the upper limb during transfusion by the intravenous drip method I have found this padding particularly useful, and can recommend it as a valuable addition to our general hospital equipment.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY DECEMBER 25 1943

TETANUS IMMUNIZATION

It has long been an attractive idea that when a patient is exposed to imminent risk of infection we might give immediate protection with antitoxic horse serum and—while he is safe under this umbrella of passive immunity—so contrive that active immunity should develop rapidly before the passive protection faded. In 1939 the unhopeful opinion was expressed¹ that “combined active and passive immunization in human medicine is not feasible, the two types of immunization being incompatible with each other.” Yet Ramon confidently stated some years ago that the goal had been reached by the method of “sero-vaccination.” Downie, Wilson, and fellow-workers² shrewdly reviewed Ramon’s data and arguments as applied to diphtheria, and showed that the experimental results did not unreservedly support his hypothesis. They nevertheless felt that there might be a place for the simultaneous administration of antitoxin and prophylactic, with the important proviso that we ought to recognize and provide for the gap that must occur after the passive immunity has waned and before active immunity has grown. From carefully controlled observations on volunteers they concluded that for diphtheria the gap could be safely bridged. Fulton and co-workers³ estimated that this danger period of intermediate low immunity would be over in six weeks. In the schools where diphtheria occurred they swabbed all the exposed children, isolated the carriers, and allowed the other scholars to continue their routine. All exposed children received about 400 units of antitoxin as well as 0.1 c.cm. of A.P.T. A month later 0.3 c.cm. was given. Two weeks later—i.e., six weeks after the swabbing and combined immunization of the children—the carriers returned to school and mixed freely with their fellows. The procedure was apparently effective, for no further cases occurred.

In tetanus the same general considerations apply. The wisdom of active immunization in advance of exposure is generally accepted, and almost all Allied soldiers are thus protected. In Germany, Wolters⁴ urged active immunization with two spaced doses of tetanus-alum-toxoid, but the procedure does not seem to have become popular. We may safely assume that the course of two immunizing injections of tetanus toxoid with a six-weeks interval—followed by yearly reinforcing (“boosting”) doses of the prophylactic given to recruits joining the British Army—confers a high degree of protection, though a few cases recently reported indicate that this immunity may not be high enough to safeguard against every possible risk the soldier runs on active service. There is no unanimity, however, about the best method of giving a man protection against tetanus when wounded. The Americans give only

toxoid to their wounded men who have been immunized before. We have recently⁵ called attention to Zuger’s results, which suggest that this procedure is good, but maybe not good enough. A secondary stimulus—the injection of prophylactic into a person previously immunized—causes a dramatic rise of antitoxin titre, but it is doubtful if even the most delicate technique would detect this rise earlier than the third day. During this period the toxin may in case of infection “outpace”—to use Colonel Boyd’s expressive term—the antitoxin-making mechanism and attach itself, probably indissolubly and fatally, to the susceptible local nerve elements.

The British plan of giving antitoxin to all wounded men can be accepted as sound, on the evidence of the 1914-1 war. The Americans use a different and interesting method. If evidence is not at hand that a wounded soldier has been actively immunized he is given a prophylactic dose of antitoxin; he also receives toxoid. If he is in the Army he gets at the same time as the antitoxin the first of three injections of tetanus toxoid given three-weekly; if in the Navy, the first of two doses of tetanus-alum-toxoid, the second being injected four weeks later. Cooke and Jones have examined this combined passive-active procedure. They had under observation 9 children suffering from tetanus and 39 healthy children. The children in one group were given passive immunity with 10,000 units, higher doses of tetanus antitoxin; but multiple injections of tetanus toxoid the week after did not result in active immunity for many weeks, nor in that period did they so sensitize the children that another injection could cause a secondary stimulus effect, with the rapid production of antitoxin. To each child in another group a dose of 10,000 units of tetanus antitoxin was given, and then fortnightly injections of tetanus toxoid. Some of the children received the first of these at the same time as the antitoxin, and continued thereafter with an injection every two weeks; in others the first of the series of injections of toxoid was given not at the same time as the antitoxin but a fortnight later; in others the first two toxoid injections were omitted, the children receiving their initial dose four weeks after the antitoxin. The striking result was that the rise of antitoxin due to the development of active immunity occurred in all groups at about the same time—ten weeks after the injection of the antitoxin. With the doses of antitoxin and the intervals chosen in these experiments advantage was gained by giving the prophylactic at the same time as the antitoxin. In the Wilson-Downie-Fulton diphtheria investigations the alum-toxoid, though injected at the same time as the antitoxin, still apparently played a vital part of primary stimulus and prepared the way for excellent response to the second injection of alum-toxoid three weeks after the first. This discrepancy between diphtheria and tetanus attempts to achieve a measure of what the Americans have called “duplex” immunity may be explicable on a quantitative basis. Mixtures of toxoid and antitoxin, used with much success in the early history of immunization against diphtheria, were effective only when the amount of antitoxin was minimal and carefully adjusted to the amount of toxoid present. Over-neutral

¹ *J. Amer. med. Ass.*, 1939, 113, 1884.² *British Medical Journal*, 1941, 2, 717.³ *Ibid.*, 1941, 2, 759.⁴ *Z. Hyg. Infektkr.*, 1942, 124, 326.⁵ *British Medical Journal*, 1943, 1, 76.⁶ *J. Amer. med. Ass.*, 1943, 121, 1201.

mixtures did not immunize, the toxoid being "blanketed" or neutralized by the excess antitoxin. This presumably occurred in the Cooke-Jones observations. Their healthy children as well as the tetanus patients had very large doses of antitoxin, and in consequence could obtain no immunizing benefit from the synchronous toxoid prophylactic.

On a review of the whole evidence there appears to be an inescapable risk in combined active and passive immunization for the prevention of tetanus. If the dosage of antitoxin is adequate to protect against a heavy infection (for which we must always be prepared), then the dose of toxoid given synchronously with the antitoxin is likely to be ineffective as an active immunizer. If, on the other hand, the dose of antitoxin is optimal—i.e., minimal—the amount circulating in the blood stream may have dwindled to a dangerously low level well before the commencing active immunity has marched far enough to become effective. Animal experiments and the recent diphtheria investigations suggest that there will always be this period of low-level immunity following "combined" protection. Experience may show that for a disease with such a variable incubation period as tetanus this intermediate phase incidental to the combined method carries with it a material risk. It is of interest that this view has now gained utterance in the U.S.A. The author of a recent "Answer" in the *J.A.M.A.* writes: "It must, however, be borne in mind that the formation of antibodies consumes time. For this reason it is always good judgment in the presence of badly macerated tissues to give immediately a prophylactic dose of antitoxic serum while waiting for the effect of the boosting dose of toxoid. . . . There will be occasions when it will be wise to employ the antitoxic serum in addition to the toxoid immunization."

ROEHAMPTON AND REHABILITATION

Roehampton, the name of a small village in Surrey, first came into history during the last war, when the Roehampton House estate was converted into Queen Mary's Convalescent Auxiliary Hospital and became a centre for the manufacture and fitting of artificial limbs. Of 41,050 men who lost a limb or limbs in the last war 26,262 were treated at Roehampton for the supply of their first, and in many cases also their second, artificial limb. About seven years after the armistice, by which time the bulk of the first and duplicate limbs had been supplied to those who had suffered in the war, Roehampton was extended to accommodate general surgical and medical cases from the Ministry of Pensions hospital at Shepherd's Bush and facial cases from Queen Mary's Hospital at Sidcup, but it still remained primarily an institution for the benefit of ex-Service men who had lost limbs. All the surgeons of the Ministry of Pensions attached to the fourteen limb-fitting centres in various parts of the country were trained at Roehampton, and here also notable progress in design and manufacture has been made. The modern artificial limb, thanks very largely to what has been done at Roehampton, is a light and simple construction, permitting leg movements scarcely distinguishable from the natural gait. The making and fitting of such limbs is a highly specialized craft, and it is

not always appreciated how it can reduce the time-lag between amputation and a man's return to more or less normal life and employment. It is not merely a question of the mechanical adjustment of a prosthesis: it is a question of re-educating a faculty, and often of reviving a spirit which may have undergone something akin to the physical mutilation. Provision is made at Roehampton for occupational therapy, with gymnasium and workshops, and for the economic, educational, and recreational re-establishment of the individual.

Gradually the work has been extended to amputation cases among civilians, in the first instance railwaymen and miners. Since the autumn of 1936 over 3,000 civilian limb-fitting cases have been dealt with under this extension of Roehampton's activities. Arrangements have been made with the Ministry of Labour and National Service for the treatment of cases falling within its rehabilitation scheme for civilians, with the Board of Education for facilities for children of school age, and with the Ministry of Health for pre-school children, mostly congenital cases. In fact Roehampton has developed from a hospital exclusively for the provision of artificial limbs for men wounded in the wars to a general supplying centre for all who need this orthopaedic service. Just as in total war the difference between soldier and civilian wears thin, so Roehampton has shown how the work of treatment and rehabilitation can cover all alike, and not only war casualties, but the accidents of industry and transport. When the present war broke out Roehampton made preparations to meet the expected new demands, and people of every category, Service and civilian, who have lost limbs have been fitted. Seventeen new wards have been built, with ancillary buildings—indeed, to all intents and purposes a new hospital has been put up near the old. The Ministry of Pensions has doubled its bed accommodation at Roehampton since 1939.

Roehampton is now seeking a still wider service, for which purpose it has recently built, at a cost of over £12,000, a large extension to its limb-fitting centre with demonstration theatre and consultation rooms; and the factories themselves, which are immediately adjacent to the limb-fitting centre and hospital wards, have been much enlarged. The idea of the executive is that a further stage in its development should be as a centre for the teaching of medical graduates of the Allied nations, many of whom are now in England, in the methods of artificial-limb manufacture and fitting, so that the Roehampton experience may in due course be carried into all the countries of Europe and help to alleviate the terrible legacy of post-war crippledom.

PSYCHIATRIC IMPLICATIONS OF SURGERY

The familiar procedures of the surgery, the clinic, and the hospital, which are daily routine for doctor and nurse, may have surprising effects on the patient, and we must be prepared to analyse repercussions in the world of fantasy as well as in that of reality. Strong men may faint on venepuncture and intelligent women show intense anxiety with fear of suffocation and death in the process of submitting to a basal metabolism test. Some patients make satisfactory adjustments to life after serious operations, while others make poor adjustments after minor ones.

Michaels¹ has considered the problems encountered by a group of medical social workers in their work with surgical patients, and writes interestingly of the psychiatric implications of surgery. Some of the factors determining the patient's reaction are the type and purpose of the operation, the structure and organization of the personality, the psychosexual development, the age of the patient when the operation is performed, and the organ involved in the operation. An emergency or life-saving operation may be better borne than a palliative or cosmetic procedure. The personality of the patient is a significant factor for the outcome of the operation, which will in some measure reflect the same pattern of reaction as previous traumatic experiences. An individual whose feelings are predominantly of a distrustful suspicious nature may come to look upon the operation as having deleterious effects upon him, even to the point of regarding himself as an experimental guinea-pig. Psychosexual factors, based on fears of attack or assault, are more important in women than in men, and for this reason women react less well to operations and more often develop post-operative psychoses. Traumatic events appear to be most harmful during the first six years of life, at puberty and the climacterium, and whenever possible operation should be avoided at these epochs. Nothing could be more misguided than the prevalent view that operations such as circumcision and tonsillectomy are without effect on the personality when performed in the early years of life. Finally, it should be noted that the organ involved plays an important part in the fantasies of the patient, and operations on the generative organs, the eyes, and the skull are of special psychological significance. There is much less unjustifiable operating to-day than 20 years ago, much better physical preparation, and incomparably better anaesthesia. But it is doubtful whether we yet spend enough time on psychological preparation and full discussion of the pros and cons of the operation. It is so easy to acquiesce when the patient says, "You know best, doctor," and forget that such an attitude may conceal a good deal of apprehension. Many of us must have had the experience of seeing a child, who had hitherto undergone investigation with good grace, suddenly scream and refuse to co-operate on the arrival of the pathologist, and one who has been almost morbidly submissive in the ward may behave like a maniac in the out-patient department. We realize then that the iron has cut deeper than we knew. No trouble should be thought too great in preparing little children for operation, and deception and trickery of any kind should be most earnestly avoided.

ERADICATION OF ANOPHELES GAMBIAE IN BRAZIL

It is characteristic of mosquitoes, as of many other forms of life, that species seldom show much tendency to spread beyond the boundaries of their natural areas of distribution. The famous transgressor in this respect has been *Aedes aegypti*, the yellow-fever mosquito, now almost world-wide in its distribution where climatic conditions permit. Of anopheles almost the only species showing any indication of such a tendency has been *A. gambiae*, the chief carrier of malaria in tropical Africa. This has apparently established itself along the adjoining coasts of Arabia and in some of the islands near the African Continent as well as having been occasionally recorded from Mediterranean ports. Nevertheless it was with much surprise that students of the group learnt of the recording of *A. gambiae* by Shannon in 1930 from the port of Natal north of Pernambuco on the Brazilian coast, the first record of an Old World species of anopheles in the New World. Within a few years

A. gambiae had been recorded from many other localities over a wide area in North-East Brazil, and when this was followed in 1938 by a severe epidemic of malaria due to this species the seriousness of the menace both to Brazil and to America became only too manifest. In the circumstances a scheme was immediately instituted under the direction of the International Health Division of the Rockefeller Foundation not merely for the control of the species but for its complete eradication—a scheme which improbable as its success may have at first appeared, has actually within two years achieved its end. Under the title *Anopheles gambiae in Brazil*¹ Drs. Soper and Bruce Wilson of the Rockefeller Foundation have given a full, detailed and very interesting and informative account of the spread and retreat of *A. gambiae* in the "invasion area" and the operations taken against this species. During 1939 *A. gambiae* continued its march up the various branches of the Jaguaribe, Assu, and Apodi rivers and along the coast of Ceara at such a rate that it was feared the infected territory would become too extensive for available funds to cope with the situation—even with adequate methods. But in 1940, when after the dry season the rains had fallen, it became apparent that the measures during 1939 had already produced an effect. By November, 1940, the Brazilian-born *gambiae* had been destroyed. The report is illustrated by a number of excellent photographs and maps, and is an outstanding addition to the literature on anopheles control.

MEDICINE IN PERSIA

One pleasant instance of the close relations between our country and Persia was the inauguration of the Anglo-Iranian Medical Society in September, with more than 100 Persian, British, American, and Indian medical men attending a reception at Victory House. The idea originated with Col. S. M. A. Faruqi, I.M.S. and D.D.M.S. in Teheran who has been untiring in his efforts to bring members of the British and Indian medical professions now serving in the armed Forces in Iran into closer relationship with Persian doctors. Dr. Habibi Adle, president of the Iranian Medical Society, has given the movement his full support as has the Minister of Health, Mr. Amanullah Ardal. A cordial agreement having been reached on this new project Dr. Faruqi then talked to the 70 or so doctors present about the problem of typhus in Iran, where many lives were lost from this disease. He feared that an even more severe epidemic would come upon them, but there were now in Iran many doctors with much experience of typhus. Dr. Faruqi suggested that a small committee should be set up at once to co-ordinate information and personnel for dealing with the typhus problem in the most effective way possible.

COLONIAL RESEARCH

Evidence of the scientific approach now being made in Colonial problems is provided by a White Paper. The first progress report of the Colonial Research Committee appointed in June, 1942, under the chairmanship of Lord Hailey, to co-ordinate the whole range of research in the Colonial Empire. The most important feature of the report is that it marks a first attempt to survey the whole field of Colonial research and its requirements. The committee has not yet been able to complete its survey of the major problems with which it is concerned, but substantial progress has been made. The schemes actually approved so far are therefore only the smaller projects.

¹ *Anopheles gambiae in Brazil, 1930 to 1940*. By Fred L. Soper and Dr. Wilson. New York City: The Rockefeller Foundation.

which can be started even in wartime. Apart from the schemes made under the Colonial Welfare and Development Act of 1940 the committee has recommended to the Secretary of State a number of other proposals, which are now under consideration by Colonial Governments. These include the investigation of alternative methods of producing cinchona for quinine; the scheme contemplates the establishment of a new Cinchona Research Institute in East Africa to experiment in methods of local production. Rinderpest and tsetse-fly research are to form the subject of a special report to the committee by the East African Governments. The Colonial Products Research Council, which is an executive body, works in close association with (and is complementary to) the committee. The council's function is to organize and sponsor research into Colonial commodities, with the primary object of finding new uses for them. At the request of the Medical Research Council it is also engaged in reviewing the field of research into vegetable drugs. Among a variety of investigations concerned with foods or drugs the production of ergosterol is being studied at the Chemical Research Laboratory of the Department of Scientific and Industrial Research by Dr. A. C. Thaysen. The council is also co-operating with Government Departments in work of which details must for the present be kept secret.

INFANT'S REACTION TO FEEDING

The diligent study of the psychology of the child goes on. D. P. Marquis,¹ working in the Yale Institute of Human Relations, has published a study on frustration reactions in the newborn. This paper, which is part of a larger general investigation of the adaptation of the infant to his post-uterine environment, seeks to describe the nature of the reaction pattern, present in the newborn, to a type of frustration common to most bottle-fed infants; the variation of the reaction pattern from infant to infant; and the factors determining individual variations if they are found to occur. The author defines "frustration," in the sense of Dollard, Doob, and others, as "that condition which exists when a goal response suffers interference."

Seven newborn full-time infants from the paediatric department of the New Haven Hospital, unselected except for the factors of bottle-feeding and normal physiological condition, were observed so far as possible for two feedings each day over the 10-day period after birth. The infants were brought to an experimental room for feeding and were placed in a bassinet equipped for automatic registration of general bodily activity. The standard feed of the clinic was used and given in four equal parts. Observations were begun after a 5-minute interval, and made over periods of 90 seconds each, beginning before the feed, between the feeds, and after the total amount had been given. A break for expulsion of air from the child was made after the second portion of the feed, and a 90-second period preceded and followed this—thus six such periods in all. The onset and duration of bodily activity, mouth activity (sucking, etc.), and onset of crying were noted. A time-marker was used. The latency and duration of each of these phenomena at different stages of the feeding were recorded. It was found that newborn infants show marked frustration reactions in the feeding situation, varying with the strength of the hunger drive. Decreasing degrees of the hunger drive were accompanied by decreasing amounts of general and mouth activity and by correspondingly increased latencies after the bottle was withdrawn at the various stages of feeding. The pattern of the frustration reaction appeared to have fairly well defined

characteristics. The frustration became greater as the feeding pattern became more specific. Individual differences in the reaction were noted.

Five of the infants were observed after 3 months, and several differences were recorded. The author suggests that from the methodological point of view her technique is a more effective way of studying emotions in the newborn than the traditional methods of Watson and Morgan, that the feeding situation is a more common or less artificial one than the sudden loud noises, etc., which these workers have employed. She believes that her results lend support to Kleitman's theory of the development of the "wakefulness of choice" as opposed to the "wakefulness of necessity," which develops as the cerebral cortex develops greater functional activity. In the neonatal period the subjects described here tended to become more and more quiescent as hunger was satisfied, whereas at three months the level of general activity remained fairly constant throughout the feeding situation, and could no longer be employed as a differential criterion of frustration. Miss Marquis interprets this as an indication that, by reason of increasing cortical differentiation, the response of general bodily activity has become attached to a growing number of stimuli. Changes in the distribution of mouth activity in the situation were observed. Mouth activity begins in most cases only after feeding has taken place, and occurs with lessening frequency as feeding progresses. The author would explain this in terms of, first, the perseveration of a neuromuscular set initiated by the act of feeding, and, secondly, by the concept of the hunger drive, which, as it diminishes, no longer produces internal stimuli and resultant strong oral or other responses. The author subjects her observations to statistical analysis, but omits to give any idea of standard error, which necessarily limits their value. The total study of which this paper is a part promises to yield useful information on infant behaviour, even if it only seems to put a controlled scientific imprimatur on observations which every mother has made.

INADEQUATE HOSPITAL DIETS

The Duke of Gloucester, speaking from the chair of the General Council of King Edward's Hospital Fund for London, announced on Dec. 14 that grants totalling £280,000 are again being distributed among the voluntary hospitals. Referring to the report on hospital diet issued by the Fund and discussed in the *Journal* of Sept. 18 (p. 365), His Royal Highness said that this report had caused concern in hospital circles, both voluntary and local authority, throughout the country. It was important that hospitals should be prompt to apply the new knowledge of the science of nutrition for the benefit of the sick within their walls, whose recovery it was now realized might be directly affected by the food they ate and by the way it was cooked and served. There was a great work for the hospitals to do in this field, and a commensurate increase in expenditure was amply justified. Already several hospitals had sought the advice of the King's Fund, and there was evidence that many were re-examining their standards of feeding. He had therefore as President appointed a committee with Prof. J. C. Drummond, scientific adviser to the Ministry of Food, as its chairman, and Sir Wilson Jameson, Chief Medical Officer to the Ministry of Health, had also accepted an invitation to join the committee. Miss Margaret Broatch, who has had wide experience as a hospital dietitian, will be dietetic adviser and take up her duties in January. It is most satisfactory that the King's Fund has not rested on its oars: the matter is one that calls for early action and constant reminder.

¹J. exp. Psychol., 1943, 32, 123.

CARE OF CHRONIC SICK

A CASE FOR TREATING CHRONIC SICK IN BLOCKS
IN A GENERAL HOSPITAL*

BY

MARJORY W. WARREN, M.R.C.S., L.R.C.P.

Deputy Medical Superintendent, West Middlesex County
Hospital, Isleworth

This contribution to the problem of the chronic sick is an effort to make a case for their treatment in a special block in a general hospital. My reasons for advocating such an arrangement are fourfold: (1) that geriatrics is an important subject for the teaching of medical students and should form part of their curriculum; (2) that the care of the chronic sick should comprise an essential part of the training of student nurses; (3) that for the proper care of the chronic sick the full facilities of a general hospital are necessary, both for the establishment of a correct diagnosis and for treatment; (4) to encourage research work on the diseases of old age which can only be undertaken with the full facilities of a general hospital. These statements will be amplified in support of my arguments.

Although the term "chronic sick" includes patients of all ages, I understand that this discussion applies principally to the problem of the elderly sick, and I therefore intend to eliminate the younger age group. Before passing on to the main subject, however, I will make one or two cursory remarks on the care of these younger patients. First, I think that they should be nursed and treated with ample accommodation in small units, and *separate* from elderly patients. Secondly, there should be adequate opportunities for medical research into the chronic conditions affecting the young and those in the prime of life. Lastly, no pains should be spared in affording these patients all the possible amenities by which their cramped and restricted lives may be made pleasanter, seeing that many of them live for several years. I have in mind particularly mobile libraries and visiting librarians, forms of occupational therapy, and concerts for those fit to attend.

To return to the main subject—the elderly and aged chronic sick—first, it must be appreciated that the number of men and women over 60 years of age has increased and is still increasing, as shown by the Ministry of Health census figures:

Population Aged 60 and over in England and Wales

1901 Census figures:

Males, 1,071,519	} 2,408,426
Females, 1,336,907	

1939, July estimate: unquoted, unpublished:

Males, 2,511,200	} 5,708,600
Females, 3,197,400	

This statistical fact means not only an increase in the absolute numbers of elderly people living but also a relative increase in the proportion of elderly to middle-aged and young people. At the present time, in my own experience—and this I have confirmed so far as is possible from other sources—women outnumber men in all institutions and hospitals where the chronic sick are catered for. Two factors, I think, contribute to this state of affairs: that the average duration of life in a woman is longer than in a man; and that it more frequently happens that a man can be cared for at home by his womenfolk than vice versa. The increase in the number of elderly people has resulted from the steady practice of preventive and industrial medicine during the present century, and is therefore a problem which has been brought about in part, at least, by the medical profession and which can no longer be ignored by them.

Specialization in Geriatrics

Although I do not claim to be a specialist in geriatrics I have for several years been much interested in the problem, and in my opinion until the subject is recognized as a special branch of medicine in this country it will not receive the sympathy and attention it deserves. Only in comparatively recent times has paediatrics really been fully appreciated as a specialty—and certainly in my student days children were too often nursed in adult wards (there being no special wards set apart for

them), and too often junior medical and nursing staff were considered all that was necessary for their care. To-day much the same attitude is shown towards the care of the chronic sick—a class which includes the majority of elderly folk—and very frequently they receive but scant attention. The proper care of the aged chronic sick requires knowledge of the elderly and sympathy with their particular requirements—and most classes of these patients should be treated in blocks as part of a general hospital. It is quite as unsuitable to treat these patients in wards for acute cases as it is to relegate them, often unsegregated, to institutions for the chronic, where facilities for diagnosis, research, and treatment are unobtainable. In the former case these worthy people, whose lives have been every whit as useful as we should like to believe our own, are ill-housed with younger folk who are irritated by them and in turn annoy them, and usually the staff has neither time nor facility for treatment. In the latter case there is usually a lack of attention and of facilities should an acute condition supervene—and, moreover, the "chronic" institution tends to attract a less good medical and nursing staff. With these points in mind, and appreciating that the problem shows no signs of diminishing in the years to come, I cannot too strongly advocate the inclusion of geriatrics in the medical student's curriculum. A comparison of the numbers of chronic sick treated in the voluntary hospitals, where hitherto most of the teaching of medical students has taken place, with the numbers treated in the municipal hospitals and other institutions bear ample testimony to the attitude of the profession as a whole to this subject.

Classification of the Chronic Sick

In 1935, by the appropriation of the Poor Law institution the West Middlesex County Hospital inherited overnight several hundreds of chronic sick patients, unclassified and ill-assorted. Early in 1936, still overwhelmed by the problem of the proper care and treatment of these patients, I interested myself in a scheme of classification, and am much indebted to my chief, Dr. Cook, for allowing me to carry out this experiment, which has been working more or less satisfactorily ever since. The classification adopted was as follows:

1. Chronic up-patients—that is, patients who get up part or whole days and can get about with some help, but who cannot manage stairs.
2. Chronic continent bed-ridden patients.
3. Chronic incontinent patients—such wards are allocated only on the female side.
4. Senile, quietly restless and mentally confused or childish patients requiring cot beds for their own safety, but not noisy or annoying to others.
5. Senile dement—requiring segregation from other patients.

I am certain that wards for such patients should be small and that day-rooms, verandahs, and occupational therapeutic facilities should be amply provided. Elderly people are essentially individualists, and provision should be made for grouping together those congenial to each other—e.g., I have more than once had patients over 70 years of age complain of being warded with "old people," and invariably such patients have been considerably more alert, although no younger, than others present, and as such should be nursed with those of equal mental capacity. With such classification the special requirements for each group can be ascertained, and in addition to the comfort of patients there is the convenience to staff, regard to exercise, and experience in nursing care. These requirements include:

Diet.—Where large numbers of edentulous patients are nursed meat should always be minced and vegetables puréed.

Linen.—Additional stocks should be provided for incontinent wards.

Staff.—Nursing staff and attendants should be arranged for, give additional help to patients in dressing and in getting up and about the ward.

Equipment.—This should include tables for games, additional easy chairs, wheel-chairs, crutches, and sticks with rubber ferrules.

Blocks thus equipped should be—and I think this very important—easy of access to all special departments, including x-ray department, pathological laboratory (plus post-mortem room), gymnasium, ophthalmic surgeon, dental surgeon, chiropodist.

* Read to the London and Home Counties Branch of the Medical Superintendents' Society.

CARE OF CHRONIC SICK

Dec. 25, 1943

Advantages of the Block System

With these facilities such blocks should provide excellent experience for teaching both medical students and student nurses, and I claim that these blocks should not be relegated to the sole charge of the newly qualified or very junior medical staff, nor be used by the matron as punishment wards for nurses. Certainly all students should be taught to recognize geriatrics as an essential and interesting part of their work.

The more time spent in such wards with full hospital facilities the greater the number of patients that can be correctly diagnosed, treated, and discharged home to the care of relatives and friends. Often education to a slower tenure of dependent senescence and readjustment to a slightly more grateful existence are what is needed, and relatives are most grateful for such treatment of their elderly folk and for advice given as to their future care at home. The number of patients able to leave such wards varies, I think, immensely with the time available and the work done. Many of the so-called "incurable" cases only need the patience, tact, and quiet energy of a staff trained to work with this type of patient to show a considerable measure of improvement. Without easy access to special departments, however, there is a strong disinclination to undertake the necessary investigations in these cases, and in the absence of a correct and complete diagnosis treatment must perforce be less efficient.

It is unlikely that facilities on the scale that I advocate would be available at a hospital for chronic sick only. Nor is it likely at the present time that sufficient medical and nursing staff of the right type would be attracted to such hospitals.

Conclusion

The urgent need for research work on senile diseases cannot be overstressed, and should be organized in connexion with wards such as I have described. With the experience obtained during the last seven years, and for the reasons stated, I do very strongly advocate treating the chronic sick in blocks allocated, equipped, and suitably staffed for the purpose in a general hospital.

It is noteworthy that geriatrics has received more attention in America than in this country, and much of the literature on the subject has emanated from American writers, notably Thewlis.

TWENTY-ONE YEARS OF THE B.P.A.

The late Dr. J. F. Gordon Dill and his friends who founded the British Provident Association, which has just completed its twenty-first year, probably had no thought in mind save to help people of moderate means, whose resources were strained after the last war, when faced with the financial burden of a serious illness. At that time there appeared no real threat to the principle of unrestricted choice of doctor and institution, and although voluntary hospitals were in jeopardy as a result of falling income and rising demands, a State Medical Service was a subject only for academic discussion. The Hospital Saving Association, proceeding by different methods and providing for a different class of the community, came into existence at almost the same time and as a result of the same solicitude. In the narrowest sense both these movements were forms of insurance; to become a subscriber or contributor was as much a matter of business as taking out an endowment policy, yet the H.S.A. has created a great co-operative movement for the fortification of the voluntary hospital, and the B.P.A. has greatly strengthened the regard for what may be called unregimented medicine. Both these movements have to be reckoned with in the future shaping of hospital and health policy.

The British Provident Association had its forerunner in a local effort in 1920, known as the Sussex Provident Scheme for Hospital and Additional Medical Services, in which a number of Sussex hospitals co-operated. In the light of that successful experiment Dr. Dill, together with Lord Dawson of Penn, the late Sir Napier Burnett, Mr. W. McAdam Eccles, Sir Arthur Stanley, Sir Alan Anderson, and others, conceived a provident scheme on national lines, to be applied first to the Metropolitan area. After discussions with hospitals, friendly societies, and

with three large London hospitals co-operating. It provided benefits for its subscribers—people with incomes in excess of those who came under the contributory scheme of the Hospital Saving Association—and began by making grants towards the cost of hospital maintenance and of consultations, expenses of home nursing, and the like. In 1925 it instituted a new form of benefit—assistance towards the fees of operating surgeons—and this was later extended to include the fees of consulting physicians. Additional privileges have been accorded from time to time, including the provision of family doctor benefit. Surpluses have been used for providing additional benefits for subscribers who have been registered for three years or longer. These benefits include payments towards the cost of manipulative orthopaedic operations and various special diagnostic and therapeutic services.

In the course of its history the association has distributed benefits amounting to some £134,000. One-tenth of this sum during the last year. But there is much more behind these figures than the reward of thrift or foresight for certain people. A great deterrent to recovery after a serious operation is the thought of the financial adjustments looming ahead, and the reflection that the surgeon's fee will be met in whole or in great part by the association's contribution, and that a large percentage of the hospital or nursing-home charges will be similarly met, contributes greatly to recovery. We cannot here recapitulate the various benefits and the conditions under which they are made; they occupy an entire booklet, which can be obtained from the office of the Association at 30, Lancaster Gate, W.2.

A BIOLOGICAL CRITICISM OF EDUCATION

In a recent address to the Leeds Medical School Sir JOHN GRAHAM KERR, F.R.S., M.P. for the Scottish Combined Universities, made some criticisms as a biologist of the Government scheme of education. He recalled his own early experience of living for a time among a primitive race of the Gran Chaco in South America and observing the system of education practised among them. In their communal evolution these people had not reached even the stage of cultivating plants or of keeping flocks and herds, but the system of education among them, to sum it up in modern phraseology, consisted simply of training in good citizenship—training to be an efficient, and therefore a happy, member of the community. It relied upon training in observation of natural phenomena, the interpretation of such observation, and the development of the habit of constant mental alertness.

The fact that education to-day in civilized communities had departed so widely from this original type was due, paradoxically, to one of the most beneficent events in the whole history of civilization—the invention of the printed book. It was the printed book which brought with it the possibility of mass education. In the age of manuscript education was centred in the religious houses, and spread beyond them only into the circles of the well-to-do. With printing it could be extended to the common people, but the teaching so given was the teaching of authority—namely, pronouncements on subjects of an abstract kind, such as theology, philosophy, mathematics, and history—and an inevitable result of the domination of the printed book was the reduction to a position of relative unimportance of training in observation, judgment, and mental alertness, which had formed so important a part of education in the earlier phases of communal evolution. While he would not speak disrespectfully of superficial culture, he was reminded of a remark about an old Clyde steamer, that she was "held together by the paint." Did we not rely in these days too much upon the paint of culture to hold civilization together?

He believed that there was an urgent call for a far more thorough overhaul of the system of elementary education that was contemplated by those whose interest was centred in improving its administrative machinery. Imprisoned in the schoolroom, the young boy occupied himself no longer with observing and puzzling out the meaning of snippets of information but rather with an uncritical absorption of detail of a multiplicity of subjects, such as geography, history, and the vocabularies of foreign languages, was relatively trivial as a means of general

mental training. He pleaded for an increased proportion of school time to be devoted to science, or, better still, to instruction in scientific method. He deplored the unfortunate effect of the dominance of the printed book in encouraging the idea that the height of a man's education was to be expressed by his degree of literary culture.

The all-important function of education, as Sir John Graham Kerr saw it, was to produce effective, and therefore happy, citizens. Success in this depended upon the successful treatment of the individual's heritage of "biological wealth"—every child born into the world was in the biological sense a little capitalist—by adding to its amount and coining it into a currency with a high exchange value in the particular circumstances in which the individual lived. In his view the primary phase of education should be devoted to the general task of laying the foundations of good citizenship. Health and strength—physical, mental, and moral—powers of observation and the interpretation of what was observed, alertness of mind and body, command of the English language and its correct and clear expression, cleanliness and godliness, personal manners, capacity for team work with its attendant discipline—these were the components of the elementary or primary phase of education, and they provided the foundation upon which must rest the later stages of education in school and workshop, in university and vocational career. Here he emphasized again that technical subjects, which had their place in the workshop, studio, laboratory, or field, must by no means be placed on a lower level than those associated with the study and library.

"THE WEEK'S GOOD CAUSE"

The coming-of-age of the B.B.C. makes it appropriate to mention the work done by that organization as a director of public benevolence. When, on Sunday nights at 8.40, while listeners are still digesting the religious service, and not yet uplifted or depressed by the 9 o'clock news, a persuasive voice comes on the wireless and pleads the cause of some charity, a hospital or social welfare organization, the ordinary man hardly realizes how widespread are the springs of generosity which are being tapped. No doubt, if there were no appeal, a proportion of the money would still find an altruistic outlet, but without the Central Appeals Advisory Committee of the B.B.C. it would be less fairly and intelligently allocated. The largest sum netted by a single appeal, in either peacetime or wartime, was £100,000 given to the King George Fund for Sailors as a result of Lord Baldwin's five minutes' advocacy in December, 1939. Since then there has been largely increased taxation and many more demands upon personal resources, yet during the first ten months of 1943 well over £200,000 was raised for various charities. Of the appeals made since the beginning of the war twenty-six have each brought in over £10,000.

The volume of response varies with the inherently appealing nature of the work pleaded for, and to some extent with the voice of the pleader, but not too much must be made of the latter. We might have a poor opinion of the persuasiveness of the new Minister of Health, Mr. Willink, when we learn that only £200 came in in response to one appeal of his, but we find immediately that in response to two other appeals of his for another cause £10,000 and £15,000 were received. It is not easy to say why the campaign against tuberculosis should stir the generosity of the public while the campaign against cancer almost invariably evokes a large response. Two broadcasts in aid of the National Association for the Prevention of Tuberculosis each brought in only about £400, whereas Lord Horder's appeal for the British Empire Cancer Campaign brought in £10,000. Another point is that, while prevention is better than cure, it has less force in a charitable appeal. The word "hospital" seems to go straight to the heart of the listening public. During the last few months, to take a few examples, an appeal for the Christie Cancer Hospital, Manchester, and the Liverpool Radium Institute brought in £6,413, for St. Luke's Hospital for Advanced Cases £3,500, and for Queen Charlotte's, the London Chest Hospital, and the Swansea General and Eye Hospital, over £2,000 each. The largest response to a hospital appeal was to that made by Mr. Donald McCullough in February, 1942, which gathered over £10,000.

The number of separate donations was 6,300, and of only 750 came from the region of the hospital (Devon Cornwall).

At the beginning of the war appeals for individual hospitals were discontinued and group appeals for voluntary hospitals were made. The first of these yielded £19,443, but the second and third brought in comparatively small amounts, and became evident that the term "voluntary hospital" have a local habitation and a name if it is to inspire belief. In the early part of 1942 it was decided that appeals for individual hospitals should be made in the course of the year, and the experiment proved a success and has continued. Specialized hospitals or those which have seriously damaged by enemy action and are not in receipt of large E.M.S. grants receive first consideration.

Three wartime broadcasts for the Invalid Children's Association brought in altogether nearly £7,000. The Services Welfare Society, as a result of three appeals for an unknown soldier of the last war, received about £11,000. British Medical Missions in Africa, following an appeal by Mr. Justice Birkett, received £7,362. The work of the district nurse, which one might have expected to open many paths to able advocates, but the broadcasts brought in only small sums to the Queen's Institute. On the other hand, the Crippled Children's College at Leatherhead and the sister college at Exeter gained over £2,000 from one appeal. The fact that these sums are in small donations, and are given in addition to the steady support of the institutions by their own constituencies, suggests again the deep root which voluntary institutions have in the pride and affection of the British people.

FUTURE MATERNITY AND CHILD WELFARE SERVICES

Last February a conference of representatives of societies concerned with maternity and child welfare set up a committee to consider how the maternity and child welfare services could best be maintained and developed "in view of the changes in medical science which may be consequent upon the Beveridge report." That committee, whose chairman was Dr. P. V. Pritchard, in its comments on the suggestion that one doctor should be responsible for the preventive and curative medical services for all children, irrespective of age. While certain advantages would result from this, the report continues, general practitioners as at present trained are not always fitted to carry out this dual role—a fact should be borne in mind by those concerned with the planning of medical education. The committee's first general conclusion is that maternity and child welfare services should be administered by a local authority responsible for the personal health services in the area. It does not concur in the view that the education of the health authority should be responsible for the care of the child from 2 to 5. The health and management of the child, at least from the age of 5 and preferably to the end of school life, should be supervised at clinics equipped for the purpose and by health visitors. In the committee's view the preventive medical services should be under the control of one "Ministry centrally and one committee locally, with the medical officer of health as the responsible chief officer." The local authority should continue to provide: (1) a midwifery service, including maternity beds for normal and abnormal cases, adequate transport, and residential nurseries for the older children; (2) ante- and post-natal clinical consultant service with specialist staff and an emergency obstetric transfusion service connected with a hospital should also be available. The medical officer of a clinic must be experienced in the general principles of the work and in obstetrics, and, if recognized consultant, should have held a resident obstetric appointment. He must also be qualified to advise and guide mothers on all that concerns their own and their child's health. Each area should have a consultant paediatric service. The important role played by health visitors is emphasized in the report, and a plan is made for increased numbers and for extended training. Health education should not be confined to the expectant and nursing mother, but should be a feature of our educational system, so that the next generation may be brought to adult life and especially marriage and parenthood with constructive health habits.

The x-ray picture of the lungs in beryllium poisoning, according to Meyer (*Beitr. klin. Tuberk.*, 1942, 98, 388) shows in the early field in some cases streaky, sharply demarcated shadows, and in more severe cases a more intensive homogeneous shadow. Up to 10 per cent. of workers handling beryllium have slight affection of the respiratory organs, and in a smaller proportion of cases there is severe lung disease with a high mortality.

Nova et Vetera

THE DIGNITY OF THE MEDICAL PROFESSION

so many men past middle age the name of Conyers Middleton known because of a few sentences in one of Macaulay's essays; possibly some readers of Lecky or Leslie Stephen have even attempted to read Middleton's *Free Enquiry into the Iraculous Powers of the Christian Church*, an early example of "debunking." In an annotation in his copy of one of Middleton's rejoinders to critics Macaulay commented unfavourably on Middleton's querulousness. Most readers would agree with Macaulay. When a doctor of divinity claims to have roved that highly esteemed Christian Fathers were shameless ars he ought not to be surprised if some of his colleagues are ide to him.

A Bygone Squabble

This peevishness is amusingly illustrated in another of Middleton's quarrels, now quite forgotten. In 1724 Richard lead devoted his Harveian Oration to a eulogy of the medical profession, at least of physicians, and spoke disdainfully of the pinion that in Rome physicians were always slaves or foreigners. It was a short oration, in a pleasantly pre- or post-randial style, and it might seem a little odd that a Cambridge I.D. should publish a pamphlet of 35 pages dotting the i's and crossing the t's of a thesis that Roman gentlemen of the republican age did not think highly of doctors, that most doctors were foreigners and many of them slaves. However, that is what Middleton did. As Allbutt in our time, with far more rudition than Middleton, has painted a picture, not essentially different from Middleton's, it is not necessary to summarize the latter's arguments.

The pamphlet was courteously written, but, it evidently annoyed not only Mead but some of his colleagues, and several rejoinders were printed. Middleton again took the eld. His second pamphlet was much longer than his first (52 ages), and is aimed against three of the rejoinders. Middleton does not cite the titles in full and I have no access to the works themselves, but their authorship can be identified with reasonable confidence. No. 1, *Notae Quaedam Breves*, etc., was the work of Joseph Letherland (1699-1764), an M.D. of Leyden and, later, of Cambridge, admitted a Fellow of the Royal College of Physicians in 1737, and at the time of his death physician to Queen Charlotte. According to Munk he was a man "of deep and very extensive learning." At the time of the controversy he was 25 or 26. No. 2, *Responsio*, according to Middleton a substantial volume, was written by John Ward (1679-1758), an L.D. of Edinburgh and professor of rhetoric in Gresham College; he was not a medical man. No. 3, *Animadversio Brevis*, was, according to Middleton, by the author of No. 1; cannot identify it.

In the second pamphlet Middleton's courtesy had worn so thin as to be imperceptible, and he makes some preliminary remarks which remind one of Macaulay's annotation. Middleton had said in his first pamphlet that it arose out of a friendly discussion in his rooms at Cambridge. Now he tells us that he had found some doctors a little too high and haughty about their profession (*vel gloriola quadam elatos, vel artis suae caritate nimis fastidiosa incensos*), and thought they should be taken down a peg or two by a perfectly courteous account of the facts. Whether Middleton was really naive enough to believe that our predecessors would thank him for this service is matter for speculation. Anyhow, this time he is not quite so careful to avoid the use of contemptuous or harsh words. According to him, although the author of No. 1 described himself as a doctor of medicine (apparently all three rejoinders were published anonymously), judging from the writer's style he was more probably a quack who harangued crowds in market-places and was wholly devoid of either intelligence or modesty, unless the fact that he did conceal his name was evidence that he was conscious of his rashness and ignorance. The author of No. 2 was a mere rhetorician who wrote bad Latin and was even more stupid than the author of No. 1—in fact a cowardly hireling ready to assail anybody for money. Middleton's belief (probably correct) that the author of No. 2 was remunerated by Mead no doubt spurred him on to special oratorical efforts. Latin, like German, is very rich in resounding terms of abuse, and it must at least be set to Middleton's credit that he did not accuse any of his opponents of murder or unnatural vice.

Of the intrinsic merits of the performance there is not much to be said. Perhaps, in these days when compulsory Latin is a memory, we overrate the learning of the early eighteenth century. One small example may be given. Tully in a famous passage (*De Officiis*, Bk. I, cap. 42) included medicine among

professions honourable "iis quorum ordini conveniunt," usually translated: "to those to whose rank, or condition, in life they are fitting." The author of No. 1 accused Middleton of ignorance of Latin because he did not know that *ordo* implied a free-born status and could not be used of a slave or freedman, whose status was a *conditio*. This charge excited Middleton to a fury which flows over two pages; but instead of quoting, with deadly appositeness, the first words of Suetonius's *De Grammaticis*, xviii: "*L. Crassicus, genere Tarentinus, ordinis libertini*," Middleton quotes a line from a comedy! The oldest profession in the world is a familiar gibe, but not exactly authority for the serious use of the term "profession." Clifford Allbutt would not have failed to score the point.

Perhaps Fellows of the Royal College of Physicians and Doctors of Divinity two hundred years ago were not much more learned but only more childish than they are now.

M. G.

PLASTER SPLINTS IN THE AMERICAN CIVIL WAR

The United States Sanitary Commissioner, being apprised of the lack of essential medical literature for Army surgeons serving in the field, sought to mend the situation by distributing brief essays, similar to our modern memoranda, on the practice of wartime medicine and surgery. One essay, "T" of an alphabetical series, opens with a short historical summary and continues with the criticism that the early surgeons used plaster-of-Paris in a clumsy manner so that a hammer and chisel were required to remove it. The encasing moulds were likened to heavy stone coffins serving well enough the purposes of interment, but wholly unsuited to the function of a splint. The improved method was based on that of Maisonneuve, who had recently revived the use of plaster splinting for fractures. Little applied the treatment in the New York Hospital in 1861, and it was so successful in fractures that the starch bandage and other methods of dressing were supplanted. It is pointed out that in military surgery the advantages of plaster are that it adapts itself to the parts and dries quickly, thus permitting the patient to be transported to more comfortable quarters. Moreover, if applied so as to leave a portion of the limb uncovered there is no danger from swelling. Windows may be cut in the splint so that wounds could be dressed and cooling lotions applied.

The procedure adopted was as follows. First, shave or oil the skin. Then make a paper pattern of the area to be covered and cut to it two thicknesses of Canton flannel or old muslin, devising windows if wounds are present; the sides of the flannel should remain about one inch apart when in position. Sprinkle plaster into an equal quantity of water to a creamy consistence. Immerse cloth till thoroughly saturated, lay it on a flat surface and smooth with the hand. Apply flannel to limb and put snugly over it a roller bandage. The limb is then held for a few minutes, extension being made if necessary until the plaster sets, when the roller bandage is removed. If it is necessary to delay the "setting" of the plaster this may be achieved by adding a small quantity of carpenter's glue.

The dressing was recommended as a valuable aid in the transport of patients, and it could be maintained with advantage during the whole course of treatment in cases of simple or compound fracture of the joints and of the limbs except the femur. In the last the dressing was applied from the pelvis to the heel for steadying the limb during the journey to hospital, where Dr. Gurdon Buck's treatment should be applied. In wounds of the knee-joint it is interesting to note that "perfect quietude" was regarded as one of the most important points in the treatment.

An illustration is given of a much swollen elbow-joint of a patient wounded at the Battle of Cross-Keys. The joint had been entered by a round bullet, which was removed two weeks later, when free incisions around the joint were found to be necessary. At this stage a plaster splint was applied to the anterior surface of the arm and retained by a transverse band above the wrist and another at the middle of the humerus, the arm being flexed. This splint was worn for a month and then renewed. The head of the radius came away and the patient recovered with some degree of motion in the joint.

Dr. Swan employed the plaster splints in several cases of fracture after the seven days' fighting before Richmond, during McClellan's campaign, and the patients were comfortably transported to Washington. Confirmation of its value came also from another seat of war—far-away Schleswig, where Louis Stromeyer Little reported that "Plaster of Paris is universally employed in compound fractures. In ten of the femur particularly it answered very well, the patient could bear to have the limb moved about and all seemed in a fair way to recover."

[A complete series of these essays, A-T, published 1862-4, is to be seen in the Library of the Royal College of Surgeons of England.]

Reports of Societies

BLOOD CHANGES IN INFECTIOUS DISEASES

At a meeting of the Fever Group of the Society of Medical Officers of Health on Nov. 19, with Dr. ANDREW TOPPING in the chair, a discussion on haematology in the infectious diseases was opened by Dr. G. W. GOODHART. In general, he said, the prodromal stage of most fevers was characterized by a polymorphonuclear leucocytosis; this persisted into the eruptive stage in coccal diseases, but in bacillary and viral infections there was a tendency to leucopenia or lymphocytosis. In scarlet fever a polymorphonuclear leucocytosis continued usually until the end of the second week of disease, and its absence in severe toxic cases was a bad prognostic sign. Eosinophilia, sometimes up to 10%, was characteristic.

Prominent in the group of diseases marked by leucopenia with a relative lymphocytosis was enteric fever. These changes were early, but their importance in diagnosis was diminished by modern bacteriological methods. Nevertheless, leucopenia was a help in diagnosis, particularly in clinically atypical cases, whereas a blood count could sometimes negative a diagnosis of typhoid which seemed clinically probable but lacked bacteriological proof. Not enough attention was paid to the characteristic absence of eosinophils in the leucopenia of typhoid. Leucopenia was not so constant in paratyphoid, and he had seen several mild cases with a persistent polymorphonuclear leucocytosis. The blood picture in measles and rubella was approximately the same: with the appearance of the rash there was leucopenia with a relative lymphocytosis which often became an absolute lymphocytosis and a rising lymphocyte count.

In rubella an additional aid to diagnosis was the appearance of plasma or Türk cells in exceptional numbers. The precise nature of these cells was uncertain, but their presence in rubella, although not constant, must be accepted as a diagnostic factor. Such a picture would be more helpful in differentiating rubella from scarlet fever rather than from measles, since Türk cells were sometimes present in increased numbers in the latter disease. Leucopenia with relative lymphocytosis occurred in mumps, and helped to differentiate it from septic adenitis, in which there was a polymorphonuclear response, and from glandular fever, although the rarer forms of this disease did show a leucopenia, distinguishable, however, from mumps by the presence of atypical monocytes in stained films. Whooping-cough differed from other infectious diseases in its absolute lymphocytosis. This was found in the catarrhal stage before the whoop developed, and might be helpful in deciding to isolate contacts early. Lymphocytosis reached its peak in the paroxysmal stage of the disease. Care was necessary in interpreting counts, particularly in the lower ranges, since the lymphatic apparatus in childhood could be readily stimulated by varying pathological processes. He would put no great stress on figures below 20,000 per c.mm., except perhaps in adults and older children, when he would require a high lymphocyte percentage unless the clinical evidence was strong. But with exceptionally high total counts comparatively low lymphocyte percentages could be accepted, for this might occur in complications. For example, in one case of whooping-cough pneumonia there were 165,000 leucocytes per c.mm., of which 46.5% were polymorphonuclears and only 42% were lymphocytes.

Summarizing, Dr. Goodhart felt it was unwise to talk glibly of characteristic counts in various fevers, since many cases ran a complete course without alteration from the normal blood picture other than could be paralleled in healthy people.

In the discussion which followed this paper, Dr. IAN TAYLOR stressed the difficulty of interpreting minor changes in the blood count in children in the absence of exact standards of normality for the various age groups. Dr. R. F. L. HEVLETT had noted that in enteric fever with a respiratory onset there was sometimes a polymorphonuclear leucocytosis rather than a leucopenia. Dr. R. CRICKSHANK wondered whether the eosinophilia of scarlet fever could be correlated with the allergic concept of scarlatinal nephritis. He had found a leucopenia with monocytosis in a number of typhus cases and

thought this blood picture might prove useful in diagnosis. Dr. A. B. ROSSER had found neutropenic 25 children of an average age of 9 years suffering from "catarrhal" jaundice.

Blood in Sulphonamide Therapy

Dr. B. BARLING said that cyanosis was commoner sulphanilamide than the later preparations. It could be in 15 to 30 minutes by intravenous administration of 10 of a 1% solution of methylene blue, or in 3 to 4 hours giving methylene blue by mouth. Thionin could be used the same way. A minor degree of anaemia was common during sulphonamide therapy. Acute haemolytic anaemia a rare but dangerous complication. In one child the haemoglobin fell from 90 to 30% in less than 36 hours, and cells might be reduced to 2 millions or fewer in an equal of time. Treatment in correct sequence was to stop the encourage free excretion by liberal fluids with alkalis, once it was known that the kidneys were working well, to blood transfusions of the correct group and Rh, remembering that one pint of blood raised the haemoglobin by about in an adult male and over twice that amount in child. Aplastic anaemia was another rare complication of sulphonamide therapy: a rapidly progressive anaemia with purpura and exhaustion was accompanied by reduction in red white cells, and platelets in the circulation and bone marrow. Rapid elimination of the drug, repeated transfusions, pentnucleotide offered the best prospect of recovery. Thrombocytopenia had been recorded in America in only 12 during sulphonamide therapy. Serious reduction in platelets could be caused by other drugs. Short of these catastrophic and rare cases of thrombocytopenia, some reduction of platelets did occur during sulphonamide treatment. A leucopenia might follow the use of sulphonamides, agranulocytosis rarely appeared until comparatively large doses of the drug had been taken over a long time. It perhaps the commonest of the unusual blood changes during sulphonamide therapy, and about 50% of the patients did

As vitamin K was synthesized by the intestinal flora, when in turn, was disturbed or inhibited by sulphaguanidine, prolongation of clotting time might be expected during use of the drug. This had been observed experimentally in animals and was accompanied by a reduction in rate of growth. Both effects could be negated by giving *p*-aminobenzoic acid or liver extract, while vitamin K corrected the hypoprothrombinaemia. In view of this it was suggested that vitamin K or liver extract should be given during sulphonamide therapy and perhaps "sulphasuxidine" therapy to lessen risk of hypoprothrombinaemia in the patient. Dr. WILLIAM GUNN said that nicotinic acid as well as pentnucleotide was doubtful benefit in agranulocytosis. He felt that repeated blood transfusion was the most hopeful line of treatment. Dr. W. H. KELLEHER described the case of a child of 1 who had been given a total of 70 g. of sulphaguanidine (daily) without any toxic effects. Dr. E. N. ALLOTT felt that "sulphasuxidine" might be more readily absorbed than sulphonamide, as could be demonstrated by blood sulphathiazole levels of 5 to 6 mg. per 100 c.cm. Similarly, in some cases over 50% of sulphaguanidine had been found excreted in urine.

CLINICAL PATHOLOGY

The first general meeting of the European Association of Clinical Pathologists was held in London at the Royal Society of Medicine on Nov. 26 and 27, with the president, Dr. S. DYKE, in the chair. At the business meeting the association formally adopted a constitution and made plans for future action, in particular towards the establishment of local branches on the Continent of Europe, and for the development of a scheme for the interchange of workers in clinical pathology between laboratories in the countries of Europe after the war.

At the scientific meeting Dr. H. BAB (Berlin) discussed the clinical symptoms of adrenocortical hypoplasia and hyper-trophy. He showed numerous photographs demonstrating the effects, resulting dwarfism, gigantism, and intersexuality, of disturbances of the axis of the adrenal cortex and also of the effects of treatment by means of preparations embodying its active principles. Dr. MANDELBAUM (Munich) described a micro-organism of the Neisseria

roup isolated from mice, peculiarly sensitive to the action of alphonamides; within two hours after being brought into contact with very high dilutions of any of the drugs of this group the micro-organism showed characteristic morphological changes. He suggested the use of this micro-organism as a means of testing the therapeutic value of new preparations of the sulphonamide group.

Prof. S. JELLINEK (Vienna) discussed the peculiarities of electrical lesions, which, he maintained, were incorrectly described as "burns." He showed numerous gross and microphotographs demonstrating that the reaction of the tissues to electrical lesions was entirely different from that to burns due to heat. Tissues affected by electrical lesions showed distortion, and although such lesions may come to harbour micro-organisms they did not become truly septic; he strongly deprecated the treatment of electrical lesions as true burns. Dr. H. POLLAK (Prague) discussed the value of the hippuric acid test of liver function in peptic ulcer cases. He recorded numerous observations to the effect that in treated patients suffering from peptic ulceration this test showed a marked deterioration of liver function with improvement as a result of successful treatment of the gastric conditions. He pointed out that the results of this investigation were capable of giving valuable information as to the fitness of the patient for surgical intervention.

Prof. M. REISS (Prague) recorded numerous experimental observations on the role of the corticotrophic hormone in secondary shock. Using rats he had found that the shock induced by the intraperitoneal introduction of hypertonic glucose could be largely prevented or neutralized by the corticotrophic hormone; further that the withdrawal of this hormone by ablation of the hypophysis rendered the animals more susceptible to shock. He suggested that shock could be more readily treated by the use of the corticotrophic hormone, which stimulated the production of a whole series of hormonal responses, rather than by the use of cortin or such similar preparations of the adrenal cortex alone. Prof. Reiss showed a hand-haematocrit for field use, capable of being worked from any rapidly rotating wheel such as that of a jacked-up motor-car.

Dr. J. UNGER (Prague) discussed the principles underlying the testing of chemotherapeutic substances *in vitro*, *in vivo*, and in tissue culture. Dr. B. L. DELLA VIDA (Rome) demonstrated crystals of the various types of drugs of the sulphonamide group as appearing in the urine of patients under treatment. Dr. ELIZABETH DELIKAT (Bratislava) demonstrated films and cultures from a case of acute and fulminating pulmonary aspergillosis. Dr. I. FREIDMANN (Prague) demonstrated the preparation and use of commercial dried egg powder as a substitute for fresh eggs in the preparation of media for the cultivation of tubercle bacilli. Dr. F. PICK (Prague) showed microscopical sections from the organs of a child who died showing extensive and generalized cellular reactions which had been variously diagnosed as infectious granuloma or as due to a congenital lipid dystrophy.

At a meeting held at Derby on Dec. 3 it was unanimously decided to revive the School Medical Group of the Society of Medical Officers of Health, and a temporary committee was formed. All those who are interested, whether at present members of the Society or not, are asked to communicate with the honorary secretary, Dr. A. A. E. Newth, 28, Chaucer Street, Nottingham.

The second annual report of the Bristol and District Divisional Hospitals Council bears out the contention of its opening paragraphs that the setting up of this council was a wise procedure in view of Government declarations on hospital policy. Recommendations have been made to the Bristol Planning and Public Works Committee on the principles to be observed in siting new or extended hospitals in the area. The council has received the report of the Bristol Hospitals Commission, and a subcommittee has been appointed to consider the geographical problem of replanning hospital and medical services in the area. The council's report on the future of pathological services in Bristol is completed and has been submitted to the Public Health Committee, the University, and Bristol Royal Infirmary. During the year a second grant of £1,000 was made by the Nuffield Trustees towards the development of hospital and ancillary medical services in the area, and of £250 towards the Council's administrative expenses. Work is still proceeding, states the report, on the preparation of a constitution for a central hospitals contributory scheme on the lines suggested by the Bristol Hospitals Commission. Reference is made to this also in a report for 1942 just to hand of the Bristol Hospitals Fund, "the official contributory scheme for Bristol voluntary hospitals." The Fund states that it has always been a keen advocate of union of all contributory schemes in the area. In the meantime it publishes some striking figures: its total income in its first year (1939) was £476, last year it was £48,394; the total income of the five Bristol associated voluntary hospitals was £178,561 in 1939 and £252,204 in 1942; the hospitals showing a surplus over expenditure of £5,027 in 1941 and £4,635 in 1942—no small testimonial to the value of contributory schemes.

Correspondence

Teaching of Anaesthetics

SIR.—The advance in modern methods of anaesthesia tends to make this branch of medicine more and more the field of the specialist. This is obviously of great advantage to the patient and surgeon for all major surgical work, and it is increasingly recognized throughout the country that the best surgical results are obtained where anaesthetist and surgeon form part of a highly specialized team. This tendency is likely to develop in the future and is much to be desired.

I would, however, put in a plea for more adequate training for the medical student in those comparatively simple forms of anaesthesia which he will be called upon to administer as soon as he is qualified. It is a commonplace these days to meet newly-qualified doctors who are incapable of giving any inhalation anaesthetic unless provided with their own particular form of gas-and-oxygen apparatus, though some are more confident than one could wish of administering the less controllable intravenous barbiturates, often with no means of resuscitation at hand.

This is a sad condemnation of our present methods of teaching anaesthetics. The contention that anaesthetics should be left to the specialist alone is an impracticable one. The newly qualified doctor is expected to do minor surgical work—such as opening abscesses, circumcisions, removal of nails, sebaceous cysts, etc.—and he should equally be capable of giving some simple form of anaesthesia for small surgical procedures.

I would suggest that the proper place for teaching medical students practical anaesthesia is, as a rule, not the main operating theatre but the dental department, the casualty department, the minor operating theatre, and the labour ward. Here they can be taught the principles of general anaesthesia, the prime importance of maintaining a clear airway whatever form of anaesthetic they employ, the use of such apparatus as they are likely to meet in general practice—i.e., simple N₂O apparatus, open-mask methods, local and intravenous methods—and how to deal with the results of an inadvertent overdose. They would not be precluded from attending operations in the main operating theatre as onlookers, but many surgical cases are as unsuitable for the anaesthetist to put into the charge of the student as they would be for the surgeon to hand over to his dresser. The student is often invaluable as a supporter of the jaw, a watcher of the rebreathing-bag, or an observer of the blood pressure, but it is not justifiable to make these duties the substantial, if not the main, part of his anaesthetic training, as so often happens to-day.

Honorary anaesthetists to teaching hospitals should naturally be prepared to give the necessary time to teaching the simple methods, and it is here under present conditions that difficulty often arises. They cannot afford the time to attend dental sessions, the casualty department, and minor surgical operations, as well as administer anaesthetics for long surgical lists. Some solution must and doubtless will be found for this. A sounder groundwork must be provided for the training of the casual anaesthetist so that he may recognize the anaesthetics he should or should not embark upon. This will in time raise the general standard of anaesthesia and improve the status of the specialist anaesthetist.—I am, etc.,

London, W.1.

K. G. LLOYD-WILLIAMS.

Nitrous Oxide Anaesthesia

SIR.—Dr. R. Blair Gould's article on nitrous oxide anaesthesia (Nov. 13) is unconvincing for several reasons. As a "non-expert" anaesthetist who has, nevertheless, occasion to give a number of anaesthetics, I should like to mention the following: (1) In his opening words Dr. Gould refers to nitrous oxide as being considered the "best" anaesthetic. Surely this statement is somewhat sweeping; there is, unfortunately, no such thing as a "best anaesthetic"; each individual case must be considered on its merits. (2) Dr. Gould sees fit to disagree with such authorities as Clement and Macintosh after first quoting them at the beginning of his article. (3) Throughout

while to repeat the opaque meal on the same day is to my mind a waste of time. If after this course the spasm and the tenderness still persist, then the evidence is very much in favour of early ulceration and probably of the mucosal type. This type of ulcer is similar to the small pin-point haemorrhagic ulcer found in the stomach, and which on occasion can produce quite a large haemorrhysis and almost invariably eludes demonstration by an opaque meal and x-ray examination.

It should be kept in mind that only a small percentage of duodenal ulcers present an ulcer crater that can be demonstrated by x-ray examination. Further, the large proportion of these showing craters have a history of long standing, but with recurrent attacks an acute exacerbation may simulate an ulcer in the acute stage. If the radiologist always waited until he could demonstrate a definite ulcer crater before diagnosing a duodenal ulcer, then he must assuredly miss many cases of early ulcer, which entails the art of finer radiology.

I prefer to retain the term "chronic duodenitis," and use it only for those cases showing chronic inflammatory changes of the duodenum, where the walls show definite thickening, sometimes with "honeycomb" effect of the structure. In these cases the primary cause has most probably been an ulcer, now healed but finally leaving these general hypertrophic inflammatory changes of the walls, which remain more or less for long periods afterwards and are noted at subsequent examinations.—I am, etc.,

London, W. L.

NORMAN P. HENDERSON.

Radiology

SIR.—In your issue for Nov. 27 you publish an article and four letters concerning radiology which together illustrate a principle very imperfectly appreciated by most practitioners—namely, the principle of relative evaluation of x-ray findings. Some doctors expect the radiologist to make a complete diagnosis in every case, while others profess complete distrust of the radiologist's report; the ideal course, in which the x-ray report on a given case is considered as one link in the diagnostic chain and is given neither too much nor too little significance, is rarely followed. Two great authorities—Sir Arthur Hurst and Dr. A. E. Barclay—have indicated the value of the x-ray examination in diseases of the gastro-intestinal tract, but in other fields the position is not at all clear.

Dr. Kemp, in his article on the use of pheniodol in cholecystography, gives a most lucid and balanced exposition of the value of the method described, and indicates the exact clinical significance of the results of the examination, while in contrast, letters on pneumonitis, duodenitis, and the value of x-ray diagnosis in tuberculosis show the confusion which may be produced in other forms of examination; and Dr. Norman Henderson finally makes an appeal for the rationalization of the practice of radiology. It has been most unfortunate that the science of diagnostic radiology depends on the interpretation of screen and film images which look as if they were actual pictures of the part concerned, and this has made many people imagine that radiology is an exact and fundamental method of examination, in which the living body is visualized and from which definite information can be obtained about its structure and function. No one imagines that an electrocardiogram or a test-meal curve is anything more than the graphical representation of the results of certain investigations, but an x-ray film is nothing more than another such graph, which can only be interpreted by comparison with records of similar appearances obtained in the past from cases of known disease. It is quite unjustifiable and misleading to attempt to place direct values on abnormal appearances which do not correspond with any known pathological condition, and such diseases as "duodenitis" and "pneumonitis" owe their existence to the need for terms to describe consistent x-ray appearances obtained in the absence of any clear-cut clinical complexes. In both these cases there must be some disease present, but only radiologists are convinced that a definite pathological entity exists, and I must admit that I often find it convenient to describe my x-ray findings in these terms, just as Dr. Wroth states in his very apt remarks on duodenitis. Dr. Fawcitt points out in his letter on tuberculosis that an x-ray examination of the chest may produce x-ray evidence of disease, but does not diagnose the disease, and his comments apply to all examinations.

Let it be quite clear what information can be obtained from an x-ray examination. First, we cast a shadow of some part of the body on a fluorescent screen or film, if necessary filling hollow organs with contrast media to enable them to make a shadow, and then we study this shadow and compare it with other shadows which have been obtained in the past and have been found to accompany certain pathological conditions. If we find that it resembles one of these we say that there is x-ray evidence of that disease and no more than that. We are not justified in saying that the behaviour of certain hollow viscera when filled with barium bears any relationship at all to their normal behaviour when dealing with physiological products, and the existence of spasm, for example, in a barium-filled colon is, as Sir Arthur Hurst recently pointed out in your columns, no indication that any spastic condition actually exists in that colon. Similarly, there is no real reason why the excretion of iodine compounds from the gall-bladder and kidneys should be related to their excretion of body substances, and, as Dr. Kemp stresses, we must be guided in our evaluation of the shadows cast by the foreign substances we place in organs by considerations of criteria which have been established by following examined cases into the operating and post-mortem rooms.

The radiodiagnostician can only perfect his power, first, by assimilating the results of past examinations, and, secondly, by following any cases which do not conform to past experience into the wards, theatre, and mortuary, and by discussions with clinical colleagues so that the correct value may be placed upon any unusual sign. Clinicians may be of the greatest possible assistance in such cases by correlating physical signs with the x-ray appearances, and Wing Comdr. Trail has published several most instructive works on chest examinations from this point of view. There is a most unfortunate tendency for radiology to drift away from clinical medicine and to attempt to become a separate science, and this is obviously not in the best interests of medical progress. It is also unfortunate that the present training of radiologists lays very little stress on the clinical aspects of disease, and the Cambridge D.M.R.E., which was the only diploma to insist on any clinical experience, is now withdrawn. The higher diploma of F.F.R. requires a high clinical standard, but few radiologists aspire to this very difficult qualification, which has acquired very little recognition outside the world of radiology.

There appears to be need for some new authority to supervise the training of future radiologists along the lines of the Royal Colleges, and to direct the general lines of radiological research into clinical channels. The present three radiological institutions take no part in education; but possibly the British Institute of Radiology may resume its educational activities, which lapsed with the Cambridge D.M.R.E., on a broader scale after the war, and so avoid forming yet another body which may, like the Faculty of Radiologists, not entirely fulfil the purpose for which it is organized.—I am, etc.,

Have.

E. MILLINGTON.

Shock Treatment of Mental Disorder

SIR.—The even course of medical evolution has been interrupted and set back, according to my view, by the treatment of mental disorder by the induction of fits—a short cut to psychotherapy and a wonderful way of doing psychiatry without having to know anything about human nature. I do invite general practitioners to state clearly whether they favour this treatment, which has features that remind one of the more violent of the mediaeval attempts to drive out evil spirits.

Actually I do not see how permission is ever obtained for the treatment to be done, as there is good evidence that when an adult gives permission for it to be done on himself he does it out of an impulse which is akin to a suicidal one. What makes a man feel like hurting himself makes him feel like allowing and even asking for shock treatment. The ethics of collaboration with this suicidal impulse is doubtful. It must be remembered that the treatment is certainly not being given only to hopeless cases; it is being tried in all types of psychological illness. Personally, I would never give permission for this shock therapy, simply because I see no way of proving that it is harmless. But I think that the profession as a whole could reasonably oppose the treatment on the grounds that it offers a by-pass to true understanding of human nature,

his article Dr. Gould fails to draw a proper distinction between the nitrous oxide anaesthesia for minor surgery, dentistry, etc., and the "secondary saturation" technique of McKesson for major surgery. (4) No clinical evidence is used by Dr. Gould in the support of his views. (5) The statement that "anaemic patients, in surgery, provide the great majority" is scarcely true of minor surgery or dentistry, but here again no distinction has been drawn.

In the course of some sixty-odd nitrous oxide anaesthetics administered in this establishment, the majority having been given by the nasal route for dental extractions, no instance of nausea, headache, or vomiting was noted, though it is admitted that patients judged likely to be anaesthetic-resistant were usually given an intravenous barbiturate. The advantages of nitrous oxide for these patients are its simplicity and the portability of apparatus, quick recovery, and freedom from after-effects. It has been my experience that the above method and anoxaemia need not be present provided that some expert barbiturate is available for those cases judged to be unsuitable for nitrous oxide. In using the gas for major surgery a full-scale Boyle's (or similar) apparatus is required, including the necessary auxiliary agents which the anaesthetist should be prepared to use, as most authorities are now agreed that the secondary saturation technique has little to commend and much to condemn it.—I am, etc.,

M. H. W. HOLLOWAY,
Surgeon-Lieut., R.N.V.R.

Trigeminal Paralysis after Trichloroethylene Anaesthesia

Sir,—Dr. McAuley's memorandum (Dec. 4, p. 713) describing cases of trigeminal paralysis following closed-circuit anaesthesia with trichloroethylene is opportune. Similar, though at present unpublished, cases are known. Silber (*Arch. Gewerbe-path.*, 1931, 2, 398) reviews the literature relating to the toxicity of trichloroethylene from the industrial point of view, and describes a further collection of cases presenting similar features. Briefly the specific toxic effect is attributed to possible decomposition products. It is pointed out that trichloroethylene may decompose to a variable extent when exposed to a temperature certainly lower than that reached by certain brands of soda lime during reaction, and also in the presence of caustic soda.

Hewer (*Proc. Roy. Soc. Med.*, 1943, 36, 463) refers to cases following the use of previously contaminated triene. Certainly in many ways the available evidence for decomposition products being formed within the apparatus itself is unsatisfactory. However, under the circumstances, and having in mind the clinical course of many of the cases already known, it would seem wise to reconsider the use of trichloroethylene in the closed-circuit parts of anaesthetic apparatus, where possible to toxic substances would collect and concentrate, at least until further observations have thrown more light on the problem.—I am, etc.,

H. J. V. MORTON,
Hillingdon County Hospital, Middlesex.

Treatment of Facial Palsy

Sir,—In the *Journal* of Dec. 11, in the annotation on treatment of facial palsy, this point is made: "The information in forming a prognosis." Unfortunately, scarcely any neurologists of to-day have received any training in testing electrical reactions of paralysed muscles, and they depend on reports sent from the massage and electrical departments, which to my knowledge are only too frequently quite unreliable. When I was house-physician at the National in 1895-7 the two residents had to do all the electrical tests themselves, and so we by practice acquired a knowledge that has proved invaluable in later life in assessing the severity and prognosis of lower neurone lesions. I may say at once that I disagree entirely with the statement I quote above from your article. Proper testing with the faradic and galvanic currents will give absolutely certain information as to the severity and prognosis of facial palsy and of other paralysed muscles.

days) after the damage has occurred, it is quite certain that if the muscular contractions are still active to faradism ten

the nerve injury is slight and will recover. At the same time the connections to the galvanic current will be brisk, but sluggish. The polar reactions, whether A.C. or K.C.C. is the greater, are of little importance. If faradic muscular irritability is totally lost ten days after the onset of the palsy, and the galvanic reactions become sluggish, then we know at once that the lesion is severe, and will lead to marked secondary contracture with overaction, and only partial recovery. If in addition to the faradic loss the galvanic reactions after a period of hyperexcitability slowly diminish and disappear after 4 to 6 weeks, then no recovery at all is likely. The only exception is when a nerve is damaged by compression, as may happen from scar, or by a haemorrhage in the bony canal. Here the loss to faradic irritability and the presence of full reaction of degeneration described above prove a severe lesion, which will be followed either by no recovery, or only slight, and accompanied by severe contracture, and perhaps clonic spasm, unless the nerve is decomposed or grafted.—I am, etc.,

London, W.1.
WILFRED HARRIS.

Ophthalmia Neonatorum

Sir,—Many years ago, when I was assistant to Dr. Henry Jellett, argyrol was substituted for silver nitrate. The late Mr. Crawley, who was consulting oculist to the Round, said he thought this step was a mistake and that the incidence of ophthalmia, which at the time was infinitesimal, would increase. He was correct! Very soon Dr. Jellett ordered silver nitrate to be used as a routine again: ophthalmia scarcely ever occurred.

Times may have changed, but in those days 1% silver nitrate seemed to prevent ophthalmia, and argyrol was definitely less effective. During my own Mastership, when 1% silver nitrate was used as a routine, there were 7 cases during the 7 years—i.e., 7 in upwards of 16,000 deliveries. We felt that the disease occurred it was due to the fact that the silver nitrate had been carelessly applied.—I am, etc.,

Dublin.
BETHEL SOLOMONS.

"Duodenitis"

Sir,—In the *Journal* in 1937 I suggested that results of the radiological studies of the mucous membrane in examinations of the alimentary tract should be received with reserve, and strongly condemned the radiologist who claimed that by employing this new technique "no duodenal ulcer would now go undetected." In fact at that time I recorded an instance of a case diagnosed by the "Berg technique" (which, incidentally, contradicted an earlier diagnosis in the same case, where other radiological technique was employed), while at operation no ulcer was discovered. This therefore supported the contention that no present-day method of radiological investigation is infallible. To-day I endorse these remarks, and fully support the observations of Sir Henry Tidy (Oct. 16, p. 473) that "radiological studies of the mucous membrane leave an unsatisfactory position." Dr. Charles Wroth (Nov. 27, p. 688) also deprecates the term, "duodenitis," which Sir Henry Tidy rightly states "is a radiographical conception without clinical, surgical, or pathological support, and without agreement among radiologists."

Dr. Wroth details a number of observations as noted in the routine examination of the typical difficult case, in which the outstanding features are spasm of the pylorus and "duodenitis" with "inverted commas." For many years past I have rejected the term "duodenitis" in such cases, and prefer to describe this appearance as that of "an irritable duodenum which may be the result of a small mucosal or submucosal ulcer not as yet having a crater large enough to be demonstrated by x-ray examination." If the spasm of the "cap" is mild or indefinite, to suggest to the clinician that the patient should be placed on a mixture containing tr. belladonnae min. 5 i.d.s. for 7 to 14 days, and then repeat the opaque meal and determine whether or not the spasm has disappeared. My experience is that it is preferable to "soak" the patient in belladonna rather than give a single injection of atropine hypodermically.

while to repeat the opaque meal on the same day is to my mind a waste of time. If after this course the spasm and the tenderness still persist, then the evidence is very much in favour of early ulceration and probably of the mucosal type. This type of ulcer is similar to the small pin-point haemorrhagic ulcer found in the stomach, and which on occasion can produce quite a large haemoptysis and almost invariably eludes demonstration by an opaque meal and x-ray examination.

It should be kept in mind that only a small percentage of duodenal ulcers present an ulcer crater that can be demonstrated by x-ray examination. Further, the large proportion of those showing craters have a history of long standing, but with recurrent attacks an acute exacerbation may simulate an ulcer in the acute stage. If the radiologist always waited until he could demonstrate a definite ulcer crater before diagnosing a duodenal ulcer, then he must assuredly miss many cases of early ulcer, which entails the art of finer radiology.

I prefer to retain the term "chronic duodenitis," and use it only for those cases showing chronic inflammatory changes of the duodenum, where the walls show definite thickening, sometimes with "honeycomb" effect of the structure. In these cases the primary cause has most probably been an ulcer, now healed but finally leaving these general hypertrophic inflammatory changes of the walls, which remain more or less for long periods afterwards and are noted at subsequent examinations.—I am, etc.,

Shock Treatment of Mental Disorder

SIR.—The even course of medical evolution has been interrupted and set back, according to my view, by the treatment of mental disorder by the induction of fits—a short cut to psychotherapy and a wonderful way of doing psychiatry without having to know anything about human nature. I do invite general practitioners to state clearly whether they favour this treatment, which has features that remind one of the more violent of the mediaeval attempts to drive out evil spirits.

Actually I do not see how permission is ever obtained for the treatment to be done, as there is good evidence that when an adult gives permission for it to be done on himself he does it out of an impulse which is akin to a suicidal one. What makes a man feel like hurting himself makes him feel like allowing and even asking for shock treatment. The ethics of collaboration with this suicidal impulse is doubtful. It must be remembered that the treatment is certainly not being given only to hopeless cases; it is being tried in all types of psychological illness. Personally, I would never give permission for this shock therapy, simply because I see no way of proving that it is harmless. But I think that the profession as a whole could reasonably oppose the treatment on the grounds that it offers a by-pass to true understanding of human nature.

just at a time when we are becoming able so tremendously to enrich our medical practice through the assimilation of recent researches in psychology.

I would go further. Planning, if it is to be as good as joggling along, must take into account unconscious factors.

There is such a thing as a doctor's unconscious antagonism to ill people who do not respond to his therapy. In my opinion shock therapy is too violent a treatment for us to be able to make use of it, at the same time being sure that we are not unconsciously intending it to hurt the patient.

Psychiatrists must know themselves very well indeed to feel happy when administering the treatment, and to withstand criticisms and even antagonism, which we must expect sooner or later in the lay press. (Attention has been drawn by your correspondent Dr. Martin Cuthbert (Nov. 20) to one type of public reaction.)

This letter is intended as an invitation to the profession generally to discuss this matter, which, on account of its ethical implications, cannot remain a purely psychiatric or scientific problem. And I should very much like to know how many there are who feel as I do that no one could have the right to sanction the giving of fits to a child.—I am, etc.,

D. W. WINNICOTT.
London, W.1.

Vasocostrictors in Coryza

Sir,—I read with pleasure the thoughtful letter of F/O T. M. Davie (Dec. 11, p. 763). One must respect the desire not to interfere with the defence mechanism of the nose, I feel, however, that this defence mechanism can be helped.

During the last few years I have had a series of x-rays of the nasal sinuses during an attack of coryza. The local treatment of these attacks has fallen into three groups: (1) no local treatment; (2) ephedrine 1% in normal saline, and volatile vasocostrictors; (3) vasocostrictors plus the addition of local medicaments which would not damage the cilia or inhibit ciliary action. Groups 1 and 2 showed no variation in the incidence of either sinusitis or transient subacute otitis media; whereas in group 3, even in those severe catarrhal epidemics which are prone to develop sinus complications, these complications were greatly diminished, and those which did occur were mild.

My tentative conclusion therefore is that nasal vasocostrictors are of real therapeutic use if the shrinkage of the nasal mucosa is not carried to excess by too strong a vasoconstrictor and the ironing out of the nasal mucosa is used to allow access of a bacteriostatic drug.

On physiological grounds I feel that the best vehicle for any nasal application is normal saline. I have had excellent results with ephedrine and argyrol in normal saline, but the solution must be in a stable form, otherwise unpleasant side-effects, such as nasal congestion and crusting of the nose, are produced, and these, of course, increase the risk of sinus or middle-ear involvements. Further, I think that the best way of applying any solution to the nose is by means of a good nasal spray.—I am, etc.,

E. CAREW-SHAW.
London, W.1

Examining the Neurotic

Sir,—Surge-Lieut.-Cmdrs. Stephenson and Cameron are to be congratulated on their comprehensive review of the symptomatology of anxiety states in the Navy (Nov. 13, 1943). This does not materially differ from the symptomatology of anxiety states identified in the Army.

The retention of symptoms alone, which is so prevalent in current literature, is unlikely to advance our knowledge of anxiety states with special reference to their precipitation in certain types under Service conditions. It is important, therefore, to correlate personality types with the relevant anxiety reaction and consider these in conjunction with remote and recent environmental factors. We wonder whether the authors have not confused physiological anxiety with morbid anxiety when they state that "the general result of our observations has been that there is a remarkable capacity for recovery from anxiety states in the average individual endowed and stable individual." We venture to suggest that the average individual does not develop an anxiety state unless predisposed to neurosis, and that otherwise the recovery of such individuals after exposure to various stresses is not in

any way remarkable. The prompt alleviation of symptoms is the most necessary part of any treatment, and the indications for the choice of treatment must be determined by the clinical condition, the intelligence of the patient, and any restricting environmental factors.

We cannot subscribe to the opinion that gastric investigation should be undertaken in all cases of neurotic dyspepsia prior to the psychiatrist being asked to examine them, for the reasons that hospitalization and investigation tend to produce gastric fixation, and psychiatric examination can in many instances positively identify neurotic dyspepsia with consequent economy in time and hospital accommodation.

Sir Henry Tidy (Journal, Oct. 16), writing on peptic ulcers and dyspepsia in the Army, states that "prolonged investigation and minute inquiries tend to produce or increase a psychoneurotic factor, and a man rapidly progresses to the state of being useless as a soldier." This is particularly true of dull highly suggestible patients who are prone to exhibit neurotic dyspepsia, and who, if investigated for a transient gastric disturbance, may permanently imitate all the symptoms which they hear and observe in the wards. The final result may well be a gastric hypochondriasis. We contend that neurotic dyspepsia should be identified by means of positive psychiatric criteria and not by the negative findings of a gastric investigation.

The early diagnosis and suitable treatment of neurotic symptoms is the only effective method of preventing their hysterical elaboration and prolongation. It is hoped, therefore, that too much attention will not be devoted to the investigation of symptoms in that class of case in which prompt recognition of the neurotic constitution is so essential in deciding appropriate treatment.—We are, etc.,

ELLIS STUNGO,
Major, R.A.M.C.

Captain, R.A.M.C.

A Case of Conversion Hysteria

Sir,—It is encouraging to find an analytical article, however untechnical, in the *British Medical Journal*, and Dr. Kanyard West is to be congratulated on having made his material so interesting, not to say exciting.

One can understand that many omissions were doubtless due to lack of space and need for condensation, but I cannot feel that even this is adequate excuse for the omission of all sexual factors in the aetiology. These factors are relatively specific in all such cases, both psychologically (early sexual trauma, libidinal fixations, inhibitions and regressions) and that in the case referred to the patient is engaged to be married, but is evidently not experiencing normal sexual relationship, with the result that immescence is presumably relatively in excess of detumescence. One can only think that the omission of this important aetiology is in deference to an assumption of general medical bias. If so it seems a pity, as it detracts from the practical and scientific value of this clinical note.—I am, etc.,

CHARLES BERG.
London, W.1.

Scabies and Impetigo

Sir,—Dr. Frewen Moor (Dec. 11) appears to suggest that scabies is commonly transmitted by the communal use of towels. Major Kenneth McIlhenny has investigated this matter, and in his book *Scabies* makes the following statement:

"Communal towels, particularly in schools, have often been blamed for transmitting scabies. I do not think that these are of much importance. In some experiments towels have been used by many hundreds of cases of scabies and later used again by unaffected volunteers without a single instance of transmission."

No doubt Dr. Moor has evidence, equally well controlled, to prove Major McIlhenny's statement is incorrect, and if he will publish such evidence the profession will be much in his debt.

As to impetigo, I imagine that the danger of spread by towels has entered the minds of most dermatologists, even though they may enjoy undisturbed nights, and that they take measures to advise their patients accordingly.—I am, etc.,

A. M. H. GRAY.
London, W.1.

Iodine Deficiency

SIR.—Referring to the letter of Dr. W. Mitchell Stevens, *ibid.*, p. 620, I should like to remark that the Swiss and, a year later, the at-that-time still independent Austrian governments realized the value of iodine in daily food long before the publication of Dr. Stevens's articles and pamphlet. The Austrian Salt Monopoly was selling, since the year 1923, so-called *Vollsalz* (full salt), which contained in each gramme of salt 5 mg. of iodine (consuming about 10 g. daily means for the day 0.05 mg. iodine). The addition of iodine to salt was introduced on the recommendation of the Nobel prize winner Wagner-Jauregg of Vienna, the inventor of the malaria therapy in G.P.I., as prophylaxis of the endemic goitre. He suggested general use and sale of iodized salt as early as 1898, but he himself mentioned that as early as 1852 recommended iodine as prophylaxis against goitre in individual cases. Dr. Stevens should therefore wonder that Dr. Fischler, the "German scientist," did not mention him as the author of the idea. I should like to add that J. Wiesel and J. Kretz (*Wien. klin. Wschr.*, 1928, p. 234), both of Vienna, called attention to the harm caused by the general sale of iodized salt, and that after careful investigations and many interesting debates in the *Gesell. d. Aerzte* in Vienna the order was given to Austria to sell pure salt generally and iodized salt only on demand.—I am, etc.,

Cambridge.

ALBERT BAUER.

Ligature of Innominate Artery

SIR.—Mr. G. F. Langley's interesting article on this subject prompts me to add another case to the recorded instances of its operation. During the last war, when Comyns Berkeley and I were the surgeons-in-charge of the Military Branch of the Middlesex Hospital at Clacton-on-Sea, I had to operate on a soldier who had had two severe secondary haemorrhages from a wound in the root of the neck on the right side. The bleeding came from the first part of the right subclavian artery, and it was impossible to place a ligature proximal to the hole in the vessel: I therefore exposed the common carotid and followed it down. I then cut away part of the sternum and sternoclavicular joint, and then, by means of a ring-forceps, pulled strongly on the carotid until the innominate could be reached. By means of an aneurysm needle I got a ligature of No. 6 silk round it and successfully tied it. I think I was lucky in that the innominate seemed to be unusually long. It is certain that by strong traction on the carotid the innominate can be lifted considerably.

The wound suppurated, but there was no further haemorrhage, and the man left Clacton for an auxiliary hospital quite well except for a sinus discharging a little pus. His subsequent history is instructive. He went from convalescent home to convalescent home, but the sinus refused to heal, and finally he was sent to one of the London base hospitals. The surgeon under whose care he came had no notes of his previous operation and did not know the nature of it. The sinus was therefore explored in the hope of finding a foreign body or an unabsorbed ligature. The result was a terrific haemorrhage of which the man died on the operating table.—I am, etc.,

London, W.1.

VICTOR BONNEY.

SIR.—In pursuance of Mr. G. F. Langley's account of gunshot wound of the innominate artery I think the following case, which occurred in the Far East 25 years ago, should be put on record.

After a midnight brawl with Japanese sailors an American seaman was admitted to the Shanghai General Hospital with a bullet wound in the right side of the neck. He was a short, stocky man, slightly deformed with hunched shoulders, some upper dorsal kyphosis, and a left-handed twist of the head. The bullet entered the neck from behind just above the margin of the trapezius, traversed the occipital triangle, and emerged above the sternoclavicular joint. Very little actual haemorrhage had occurred, but an arteriovenous aneurysm was apparent, springing from the depths behind this joint.

On the following day the swelling had increased in size, reaching upwards to the level of the lower margin of the

thyroid cartilage. As it seemed too hazardous to approach from below, I decided to try the effect of distal ligature, and tied the common carotid and jugular vein above the margin of the tumour. No ill effects ensued, and in two days' time the pulsating swelling was reduced in size by about one-third. For the next two days conditions became rapidly worse, the globular, vibrating mass filling the whole of the right side of the neck. For the first time the man's pluck and dry humour deserted him, the constant noise swirl, and vibration prevented any rest, and immediate intervention was imperative.

The dissection to the lower margin of the tumour was through a mass of seething, frothy, pulsating tissue, quite unrecognizable anatomically. The artery deep below the xiphisternum was isolated and ligatured with strong silk, and almost immediately the huge swelling subsided under one's eyes like a pricked bladder. At the same time pulsation in the brachial and radial pulse ceased entirely, to reappear twenty-four hours later. Recovery was complete without any untoward cerebral symptoms, and in two or three days' time the man was his old humorous and contented self.

My purpose was to find the artery, whatever it was, that entered the aneurysm from below, and, not having removed any bone to reach it, I assumed it to be the base of the carotid. The signs of complete cessation in the subclavian circulation, however, unless due to a sympathetic spasm of the artery, would point to my ligature having been placed below the bifurcation of the innominate artery. The drag of the rapidly expanding tumour on the artery and the kyphotic abnormality seemed to make it possible that this was so, but I hesitate to suggest this case being added to Sir William Wheeler's list of innominate ligations.—I am, etc.,

Guildford

W. B. BILLINGHURST.

Toxic Goitre

SIR.—I should be glad if you would allow me to enlarge on the remarks on toxic goitre in the excellent and concise paper by Drs. Linnell and Thomson (*Nov. 6, p. 574*), with which I agree heartily. Up to 1933 the young and gifted surgeon Prof. A. W. Meyer, Berlin, had operated on 200 cases of thyrotoxic goitre as a rule with previous preparation by a 3-weeks period of rest and of iodine treatment (Plummer). Although many of these cases were in an advanced stage of the disease he had not lost a single case. A number of the patients had been sent to him by myself, and like many other doctors I have since made it a rule to have all cases of thyrotoxic goitre operated whose B.M.R. was raised by more than 30%. In all these more serious cases internal treatment by rest, C.H. diet, or x rays had given poor results. Since then I have seen only one failure of the operative treatment, and that proved to be a cancerous growth in the remainder of the gland leading to the fatal end.

It remains to be seen whether the most recent types of internal treatment will give the same good results.—I am, etc.,

Buxton.

E. M. FRAENKEL.

Medical Boarding for the Merchant Navy

SIR.—I have read Dr. S. H. Waddy's letter (*Aug. 21, p. 248*) with great interest and also those of Dr. Alec Wingfield and Dr. C. E. Sundell in subsequent issues. I feel that these letters are written from two different aspects of the same subject. Dr. Waddy is speaking mainly of malingers wishing to "sign off" who obviously will not go to the Seamen's Hospital but to their own panel practitioner, whereas Drs. Sundell and Wingfield see the genuine sick of the Merchant Navy at this hospital. I have been at sea with the Orient Line for seventeen years and have also held various posts at the Seamen's Hospital, Greenwich, and can therefore speak from both aspects.

The first point that I should like to emphasize is that the problem is different in war from peace. In normal times a man comes to sea for various reasons, but in the main because he wishes to adopt that life, and, having found a shipping company to suit his particular taste, may remain in its service for twenty years or more. These men do not mangle. On the other hand, in war, and increasingly so of late, there is the youngster who has joined the Merchant Navy because of better pay or living conditions than he would get in the Services, who has no interest in the sea or in the shipping company. These are the men who cause the trouble. There seem to me to be two major problems.

1. How to deal, on a national basis, with the man who is totally unfit for sea service and is sick most of the voyage, "signed off" on the return to the United Kingdom, goes on the pool only to return to another shipping company, and so on for the duration? I have had among my crew neurotic, depressed men, who have been invalided out of the Army as unfit for further service, also men with recurrent duodenal ulcer, etc. No short examination by a ship surgeon can avoid these cases being "signed on." My suggestion is medical history cards for every man, which would at least prevent these cases being taken on ships again and again.

2. How are we to deal with the seaman who goes on leave, reports to his general practitioner with some trivial complaint, and obtains a medical certificate of unfitness, and has to be "signed off"? This practice is on the increase, and is not entirely due to true malingering, but often to a natural tendency to "wangle" extra leave on the pool. This voyage, covering four weeks, in a crew of 350 we have had 8 cases of this kind. Sometimes, to my knowledge, in the case of a trivial complaint where the man has previously been my patient, the certificate is inaccurate. In others the certificate should never have been given. For this, blame attaches to the overworked and possibly too sympathetic practitioner. These cases, I think, can only be met by insisting on certificates from medical referees, such as Board of Trade doctors, Admiralty surgeons, Navy or Army medical officers, etc.

The problem is important, and increasingly so. It is no help to say, as Mr. Greany of the Shipping Federation states in his letter (Oct. 2, p. 435), that ships are not prevented from going to sea by the low physical standard of the crew. This is true, but the ship has to sail, and other members of the crew do the work of the sick and of the men who fail to return owing to "medical certificates." This results in increased genuine sickness, and in prejudice among the rest against the system which allows it—I am, etc.

H. M. ROYDS JONES.

"Load Stretcher by Two Bearers"

Sir,—The following method of loading stretcher when only two bearers are available is suggested as an improvement on the present, generally accepted, R.A.M.C. mode of procedure. The modern trend of first aid is towards simplicity, ease of performance, and economy in personnel—i.e., two bearers per stretcher. The method described renders the task of loading a heavy patient quite an easy matter for two light bearers.

Blankets: Prepare stretcher with two blankets in the usual manner. Blanket No. 1 lies across the stretcher; No. 2, folded in three, lies downwards from shoulders to feet. The lower ends of No. 2 are opened out to provide later cover for the latter. Now carry the left free end of No. 1 across the stretcher and back again till

Position of Blankets

P.S.—Since writing the above I have tested the suggested "load" in the following manner: Two recruits who had joined only a fortnight before with no knowledge of stretcher work, one weighing 9st. 2 lb. and the other 9 st. 3 lb., were asked to load a sergeant who weighs 16 st. 7 lb. Using the above method no difficulty at all was experienced. An attempt to load by the R.A.M.C. method was distinctly a failure.

Agents Provocateurs

Sir,—Mr. Reginald Payne's admirable expose of the nefarious activities of the *agent provocateur* (Dec. 4, p. 725) is strong. Yet on mature consideration it might appear over-lentient toward this most deplorable practice and its instigators. If the desideratum of "mutual confidence between a doctor and his patient" is not always achieved nowadays, it is perhaps because the patient senses that his medical adviser is insidious, a quasi-judicial role, as Mr. Payne has pointed out. But this aspect of the doctor's work is merely emphasized by wartime conditions of life and work. Where he has to grant or withhold a certificate of a consequential nature, the conscientious medical man is always alive to his legal status and responsibilities, and tries fully to understand and justify to determine as the issue between the patient and his employer, or the State, as the case might be; a *fortiori* he will do so in time of war. In return for this service to the community, is he not entitled to expect that the evidence laid before him will be substantially true? Ought it not to be an offence to fabricate evidence for the purpose of getting a certificate under the National Service Acts or even the N.H.A. Act?

The honest G.P. will own frankly that he often gives a certificate without examining the patient properly, for the proper examination so often demands the use of apparatus he has not got and the co-operation of colleagues not to hand. If a man makes out anything like a *prima facie* case for a duodenal ulcer (albeit verbally, with no physical signs) is he to be refused his note pending the x-ray examination and the test-meal? Shall we be influenced by the fact that he may easily be a malingering who has conned his symptom-complex from some simple book on medicine for the layman? The judge or magistrate would admit that he has to make a hot of "interlocutory injunctions" or "provisional orders" before he has fully gone into the rights and wrongs of a case. In practice there may be little to be feared. The *agent provocateur* will always have to be a new case in a stranger's

I fortunately we know at least 95% of our human material in a given individual can roughly gauge the "coefficient of exaggeration" (if I may coin the phrase) and duly allow it. But in principle the thing is all wrong. It becomes Executive that shows such a complete failure to understand true doctor-patient relationship to be proposing the imposition of an autocratic control over and management of medical transactions. A few more cases like this one and Government will have alienated its most fervent supporters control within the ranks of the profession. Such a policy will do more than all the resolutions of committees and references to dispel the last fond hankerings after the projected State Medical Service.—I am, etc.,
Birmingham.

PETER PARRY.

The Army's Steel Helmet

SIR.—There have recently been several references in the lay press to the future issue of a more efficient steel helmet for the armed Forces. The issue of this new-pattern helmet seems long overdue. The present type was introduced in the 1st war to give protection against falling shrapnel—i.e., rounded steel balls which were discharged when the shrapnel shell burst in the air. This type of shell is now obsolete, and the present need is for protection against bomb and shell fragments moving more or less horizontally. For this reason a design of helmet that affords protection to the side of the head and the back of the head and neck is essential.

The brim on the present old-fashioned helmet was useful against small objects falling nearly vertically, and is still useful to the police, wardens, and others who have to be out of doors in a heavy anti-aircraft barrage. But in the front line there is the danger that blast from shells or bombs bursting on the ground near by may get under the brim and throw the helmet forcibly upwards, causing injury to the neck by action on the chin-strap. As the old-fashioned helmet is worn high up on the head it is liable to fall off during violent combat.

It is to be hoped that a large-scale issue of the new-pattern helmet, in which the old faults are eliminated, will be made with the least possible delay. The present intention, so far as can be learnt from Press reports, is to withhold the new helmet until an individual's present one becomes unserviceable. As a steel helmet does not ordinarily wear out, the present policy would appear to delay unnecessarily an obvious protective policy. It would be of interest to know the views of cranial surgeons on the necessity for the rapid large-scale issue of the new-pattern helmet, which remedies the defects of the old model.—I am, etc.,

London, W.1.

CLEMENT FRANCIS.

Pre-Nazi Medicine in Vienna

SIR.—As a native of Vienna who worked there in hospitals and in general practice for some 20 years may I be allowed to ask Dr. Alan Maberly (Nov. 20, p. 661) what he means by "State medicine in action in Socialist Vienna"?

There were in Vienna nine hospitals under State administration. One big general hospital, several children's hospitals, some other institutions, and welfare centres of various kinds were run by the city administration. A number of hospitals were private—you may call them voluntary institutions—on a non-profit-making basis. Save in a few private hospitals the whole staff were salaried, but the chiefs of the departments and senior assistants were allowed private consultant practice.

I found no difference in the treatment of the patients as human beings either here or there. I wonder where Dr. Maberly found his "Case No. 793." There was nothing like that in my time, and no patient was referred to by a number. As a matter of fact, in all my 13 years of hospital practice in Vienna we used to call the patients by their names; no number was ever known to me, though, of course, each case had to have a file with a number, but this was no concern of either doctor or nurse. The treatment was the responsibility of the senior, without any outside interference. Not even the director of the hospital, though a medical man himself, had any say in the treatment.

There was certainly no "State medicine" in general or specialist practice. It was either private or health insurance practice, which latter included all specialist and ancillary

services as well as institutional treatment. Thus the health insurance patient could see the specialist without cost to himself, either in the specialist's rooms or in certain clinics arranged by the H.I.; and, of course, the specialist could be consulted at the patient's bedside, if necessary, at H.I. expense. Therefore the out-patient departments of the hospitals were not overcrowded. Co-operation between G.P., specialist, and hospital was smooth and easy; there was never any difficulty about seeing the senior surgeon or physician at his round at hospital. Operations were arranged, when desired, at a time convenient to the G.P., and in any case he was invited by telephone. The family doctor was thus in a position to follow up his patients at all stages, for the mutual benefit of patient, doctor, and hospital staff. True, this smooth co-operation was only possible because the average doctor in Vienna was not so overworked as his British colleague, and usually there was no morning surgery occupying the better part of the morning.

As to the political side, the Government of the Republic of Austria, which controlled the nine State hospitals, was never Socialist, though for a short time, in a Coalition Cabinet, the Socialist Prof. Tandler was Under-Secretary of State for Health. He was later, as an alderman, responsible for the health services of the City of Vienna, which included, as mentioned above, a fraction of the hospitals only. His work in this sphere was undoubtedly to the credit of the Socialist administration which was then in office.

I am grateful for Dr. Maberly's kind remarks about the Viennese doctors and surgeons, but cannot see his point in comparing them with tax collectors. I felt it a duty of gratitude to my old teachers, as well as to this hospitable country, its splendid medical men and women, and its admirable people to correct a slight misconception.—I am, etc.,

Birmingham.

E. REICHENFELD.

Medico-Legal

FRACTURE OR PERTHES'S DISEASE?

In a case which came before Mr. Justice Oliver at the Leeds Assizes on Nov. 24 Mrs. Wheeler claimed damages against Dr. F. J. Stevenson on the ground of his alleged failure to diagnose a fracture of the neck and head of the femur following an accident when she was knocked down by a motor car in January, 1937, and after receiving emergency hospital treatment for injuries to the head and bruising of the right hip, came under the care of Dr. Stevenson, her panel doctor, who attended her for a period of about three weeks. She further alleged that his failure to recognize the condition or advise x-ray examination resulted in the fracture remaining undetected until March, 1943. At the time of the accident Mrs. Wheeler was aged 27 years.

The defence, which was undertaken by the London and Counties Medical Protection Society, claimed that the plaintiff had never suffered a fracture and that her condition was due to another cause—namely, Perthes's disease (osteochondritis deformans juvenilis; pseudocoaxalgia).

Mrs. Wheeler stated in her evidence that she complained of pain in the hip to Dr. Stevenson, that he examined her hip once or twice and told her she could get up. When she did so her leg was stiff and her hip painful. Before she returned to work she again saw Dr. Stevenson as her hip was painful, and he told her it was rheumatism. She continued at her work until 1938 when she married, and although she had continued pain she did not consult a doctor until 1942. It was then, as a result of x-ray examination, that she was told that she had an old fracture of the neck of the femur, impaction of the head of the bone, comminution of the head, and there appeared also to have been a fracture of the roof of the acetabulum.

Mrs. Wheeler called Mr. R. Broomhead, F.R.C.S., Dr. J. A. Thomson, and Dr. W. A. Rowden. The Society, on behalf of Dr. Stevenson, called Sir Charles Gordon-Watson, F.R.C.S., Dr. H. K. Graham Hodgson, and Brigadier W. Rowley Bristow, F.R.C.S. Brigadier Rowley Bristow, in his evidence, said he considered the x-ray photographs revealed evidence of long-standing abnormality in the hip-joint which had occurred during growth. He saw no evidence of a fracture. His evidence was supported both by Sir Charles Gordon-Watson and by Dr. Graham Hodgson.

In his judgment Mr. Justice Oliver said that the plaintiff had to satisfy him on two points: (i) that the doctor was negligent, and (ii) that as a result she had suffered damage. He went on to say that if the plaintiff satisfied him as to negligence he was quite satisfied that she had suffered no damage. He was quite satisfied that

Dr. JESSIE MILLNER CAMPBELL GRAY, a veteran medical missionary, died suddenly at her home at Church Streeton, Shropshire, on Dec. 6 in her 85th year. Dr. Gray was the eldest of seven daughters of the Rev. A. C. Gray, for many years a Baptist minister of Lewisham. She was a student at the London School of Medicine for Women from 1888 to 1892, when she graduated L.R.C.P. & Ed., L.R.F.P.S.O. & Glasg., and proceeded to the mission field in India. The first post in connexion with the Zenana Bible and Medical Mission was at the Victoria Hospital, Benares, of which later she became the head. She was in charge of hospitals for women at Patna, Lucknow, and Nasik. While on furlough in 1916 she studied recent improvements in the treatment of tuberculosis and returned to take charge of the sanatorium for tuberculosis at Alimora. At the age of 70 she retired to England, but at the urgent request of the Society for the Propagation of the Gospel she again returned to India to take charge of St. Columba's Hospital, Hazaribagh, until her health failed a year or two later. Dr. Jessie Gray was a woman of great determination and strength of character. Her whole life was devoted to her work in India, where she left many devoted colleagues and friends.—R. W.

UNIVERSITY OF DUBLIN

The following candidates have been approved at the examination indicated:

M.B., B.Ch., B.A.O.—W. E. C. Allt, W. H. Ashmore, Mary B. Kelly, H. Links, Mary E. G. Millidge (formerly Fleming), I. B. O. Ogun, O. Onibwe, Margaret S. O'Riordan, A. K. D. Rutherford, Sheila Sheehan, D. H. Siddons, J. T. Sweetnam, A. P. Whyte, F. B. B. Woods.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

At a meeting of the Council held on Dec. 9, with Sir Alfred Webb-Johnson, President, in the chair, Sir Girdling Ball was appointed Bradshaw Lecturer for 1944.

Diplomas of Fellowship were granted to the following candidates:

R. B. K. Risford, G. Wynn-Williams, K. W. Powell, G. B. Jones, M. D. M. O'Callaghan, D. MacG. Jackson, B. P. Moore, A. G. Leacock, H. E. Lockhart-Mummery, R. Bewick, C. R. Rapp, H. D. Drury, W. G. Holdsworth, A. D. McLachlin, O. B. Dickinson, R. A. Christianson, Margaret R. Dix, J. D. T. Jones.

A Diploma of Membership was granted to T. A. Quilliam.

Diplomas in Anaesthetics were granted jointly with the Royal College of Physicians of London to the following candidates:

G. Bellman, J. Sauter, J. A. Cochrane, Doreen M. E. Cranch, J. M. Cribb, H. W. Davies, R. G. B. Gilbert, L. M. Hampson, R. L. H. Harris, K. O. Harrison, Margaret Hawksley, R. A. C. Herron, J. T. Hunter, R. S. Kay, Rosalind S. McGowan, Dorothy B. J. Montgomerie, F. L. E. Musgrove, A. Pearlman, J. M. Pusey, E. N. D. Repper, Alison Ritchie, W. M. Shearer, R. G. Sheppard, W. J. Stevens, S. V. Strong, Helen M. Wood, J. W. Woodward.

Medical Notes in Parliament

Medical Officer at Detention Barracks

Major GATES inquired on Dec. 14 whether any decision had been reached with regard to the medical officer in charge at Fort Darland detention barracks immediately before the death of Rifleman Clayton.

Sir JAMES GRIGG replied that immediately after the death of Clayton on March 17 arrangements were made for a court of inquiry to investigate and report on the cause of his death. It reported that Clayton had died from natural causes, but that his death was accelerated by ill treatment and injuries which he had received. A separate second court of inquiry set up to inquire into the medical aspect of the case found that the medical officer at Fort Darland had made an error of judgment in the diagnosis of the case after carrying out a full examination of his patient, but that he was not guilty of negligence. This opinion was confirmed by the Director-General of Army Medical Services and the Consulting Physician to the Army. Sir James Grigg said he had accepted this opinion.

The report of the Oliver Committee was published on Nov. 22.¹ Its recommendations had been and, to some extent, still were being examined. They had all been accepted in principle, and most of them were being implemented.

Sir James Grigg circulated a statement showing the progress so far made in implementing the recommendations of the committee which concerned the Army. On the recommendation that a whole-time medical officer should be appointed for each establishment and that changes of such officers should be infrequent, the statement said that with the present shortage of doctors it was impossible to implement this recommendation in full now. Steps had, however, been taken to ensure that a medical officer was immediately available at each establishment if required. Medical officers were, however, attached for full-time duty at the larger detention barracks, of which Fort Darland was one. The committee also recommended that sick quarters should be provided in all establishments where they did not exist, and the statement said that "a full report on detailed requirements to implement this recommendation has been called for from the Commands concerned." Finally, the necessary improvements in night sanitary arrangements were now being carried out.

Medical Man-power

On Dec. 7 Sir RALPH GLYN asked the Minister of Health to consult the medical committees of the London general hospitals as to steps to be taken to meet the most recent requirement of doctors to join the Services. Mr. WILLINK said his medical officers would, as always, consult with, and so far as possible advise, any hospital in special difficulty with regard to medical staff. The decision to accelerate the recruitment of a certain number of recently qualified doctors holding house appointments in hospitals affected far less than half the total of doctors

holding such appointments, although in individual hospitals the proportion could be as high as one-half of the house officers. The recruitment referred to should not result in depriving civilian patients of essential treatment. Special arrangements were being made whereby the doctors would not be required to take up duty with the Forces for a few weeks. In addition, the Service Departments were prepared, on the request of Ministry of Health officers, to make the services of their medical officers available so far as possible to hospitals in urgent need of such assistance. The average number of civilians per general practitioner was rather under 3,000 over the country as a whole.

Water Supply Survey

On Dec. 7 Miss HORSBROUGH informed Mrs. Wright that it was the duty of every local sanitary authority to take such steps as were necessary from time to time to ascertain the sufficiency and wholesomeness of the water supplies in their district. The systematic long-term measurement of water resources was a matter for the Inland Water Survey, whose work consisted of recording, collating, and publishing measurements of the flow of rivers, and, in conjunction with the Geological Survey, estimates of yield of underground sources. The activities of the Inland Water Survey had been generally suspended during the war, since the central and local personnel concerned had necessarily been engaged on work more closely related to the war effort.

Reorganization of Medical Services

On Dec. 8 in the House of Lords Lord Addison opened a debate on the problems of reconstruction. He moved that the House welcomed the appointment of a Minister of Reconstruction—Lord Woolton—with Cabinet rank, and urged early announcement of decisions on the matters of policy affected.

When the debate was resumed on Dec. 9, Lord HORDER said that Lord Addison, in discussing the province of the Ministry over which Lord Woolton now presided, had not mentioned health services. In that matter they were back at scratch after a first start which had not been too happy. He understood for these services they had not to look primarily to the Ministry of Reconstruction but to the Ministry of Health. For the medical profession Lord Horder offered Mr. Willink the utmost help in his difficult work. He wished to correct an erroneous assumption about the attitude of doctors toward Assumption B of the Beveridge report. That assumption was that all preventive and curative medicine, knowledge, and skill would be available to every citizen. Lord Horder said he spoke for no official body of his profession, but he felt that, as a profession, doctors were anxious to assist in implementing that assumption, which had received in principle the Government's support. For Lord Woolton to suggest policy in this matter of reorganizing the medical services would be a great help. He was satisfied there would be conference and suggestion about the reorganization. To begin with the machine rather than with the man who drove the machine might be more fruitful of results. With regard to the machine, the voluntary hospitals were a large body of highly efficient, well-administered institutions. Team work was based on hospitals, not on individuals. Until there was a proper linking from the domiciliary medical service up to and including the large teaching and research centres based on a university, a large part of the doctor's time, especially of the country doctor, would continue to be absorbed in making the necessary contact to get what he knew his patient required. The body of knowledge and skill in medicine could never be made available to the citizens until the machine was improved by regionalizing hospitals. Doctors had pressed for years that dependants of the workers should be included in the National Health Insurance scheme. "Health centres" and "preventive medicine" were becoming a cliché, but they were doing nothing about positive health. Peckham, the pioneer health centre, had gone into cold storage, but what had been done at Peckham should be a national effort. By regional hospitals, by centres for dealing with positive health, and by expanding the National Health Insurance scheme to include the dependants, reorganization of medical services could be obtained more quickly and with less bitterness of heart than by saying to the doctor, "We wish you to be a civil servant." He thought the public now shared the feeling that it would not be in the public interest to convert the medical profession into a civil service. But if Parliament was going to hand voluntary hospitals and doctors to local authorities, should not something be done first to prepare local authorities for exercising these new powers and availing themselves of these new opportunities? Quite early in the conversations there had been a feeling that a spirit of partnership was not shown between those who stood for the local authorities and those who stood for the fortunes and for the efficiency of the voluntary hospitals. So the conversations broke down. Now they were back at scratch, and a great opportunity existed for

¹ See *British Medical Journal*, Dec. 11, 1943, p. 764.

The new Ministry of Health, with the suggestions and even guidance of the Ministry of Reconstruction, announced that the primary responsibility for housing would continue to rest with the Ministry of Health.

Influenza Epidemic

In reply to Mr. Douglas on Dec. 9 Mr. Willink said: "Arrangements have been made with the Services for temporary transfer of the call-up of doctors. I have, in consultation with other Departments and with voluntary organizations, considered what can be done to assist, particularly in regard to medical and nursing services, special help in the home, and arrangements for meals. I am issuing a circular informing local authorities of this action and making suggestions for their guidance."

Parliamentary Medical Committee

On Dec. 9 the Parliamentary Medical Committee met at the House of Commons and elected its officers: chairman, Dr. A. B. Howitt; vice-chairman, Sir Henry Morris-Jones; hon. secretary, Mr. Hugh N. Linstead; representatives on the Central Medical War Committee, Dr. Haden Guest; hon. treasurer, Sir H. Morris-Jones. Sir H. Morris-Jones becomes hon. treasurer for the fourteenth year.

World Problem of Adequate Food

During the debate on reconstruction in the House of Lords on Dec. 10 Lord SOUTHWOOD said that it was conceded that in the years before the war about half the children in this country and more than a quarter of the adults were not properly fed. Since then considerable improvements had been made, but the world as a whole, 50% of the people lived on inadequate diets. In Asia the underfed amounted to 75% of the population. The problem was a world one, and its solution must be international. He urged the Government to plan for increasing foodstuffs. All families should be in a position to have liberal supplies of milk, eggs, fruit, dairy produce, and other health-giving foods. The Government should include an educational campaign on food in its post-war plans. No. 1 priority should be milk.

Surgical Staff of Central Mediterranean Forces

Sir James GRICE on Dec. 14 assured Mr. Barile Bull that the surgical staff in the hospitals of the Central Mediterranean Force was sufficient to deal with the casualties. He was satisfied that the universal short-rotation of doctors the Army could not have as many doctors as age of doctors. When Armies moved across the seas, as in the case of the Forces which invaded Sicily and Italy, hospitals were established on the other side. Sir James added that he was unaware that at one hospital of the C.M.F. there were only one or two surgical specialists, who were responsible for over 2,000 beds, with an average of 900 surgical cases.

Price of Insulin.—Miss HONSBROUGH, in reply to Mr. Alfred Edwards, said Mr. Willink was not aware that materials used for treatment of special diseases prescribed by doctors under the N.H.I. were exorbitantly priced and, in one case, rose from £1 10s. to £1 15s. The price of these glands was considerably higher than the price of the raw material itself, which had fallen very much since insulin was introduced in 1923 and was not now much higher than just before the war. Mr. Willink did not see any necessity for instituting control of such material.

Resentment of Disabled.—The arrangements for interviewing men and women who are discharged from the Forces on medical grounds or because of disability include interviews at hospitals and other invigilating establishments as well as at employment exchanges. Special medical advice as to the individual's condition and as to the most suitable kind of occupation. All local offices of the Ministry have full particulars of the training and other schemes designed to assist the satisfactory resettlement of persons suffering from any form of disability, whether as the result of service with the Forces or from other causes.

Conscription for Work in Mines.—Mr. ERNEST BEVIN announced on Dec. 2 that it would be necessary to call up men for the coal mines in the same way as they were called up for the Armed Forces. A scheme for the selection of men for this purpose had been worked out from other causes.

Medical News

The American Pharmaceutical Manufacturers' Association has made its Award of Distinction for the year 1943 to Prof. H. W. Flory for his study of penicillin as a therapeutic agent.

At a meeting of the Clinical Society of the Royal Eye Hospital to be held at the hospital on Friday, Jan. 14, at 4.30 p.m., a talk will be given by Mr. Frederick Ridley on "The Tears."

Wing Commander Kenneth Robson will give the Goulstonian Lectures before the Royal College of Physicians of London on Jan. 13, 18, and 20, at 2.30 p.m., at the College, Pall Mall East.

Dr. T. Simpson Crawford, medical officer of the Welshpool Road first-aid post, Glasgow, has arranged a series of popular lectures for the present winter and until next June with the theme and subject of both subjects and lectures. The syllabus is evidence of actual war, though he has given to the choice of both subjects and lectures. There are, of course, lectures on certain aspects of actual war, but other subjects include plastic surgery (Mr. T. Gibson), brain surgery (Mr. J. Sloan Robertson), anaesthesia (Dr. Alex. Forrestier), fracture and rehabilitation clinics (Mr. James Fairclough), immunity (Dr. A. Miller), sick children (Dr. Finlay Ford).

Medical officers of health are asked to supply the Ministry (on Form T.147) with the necessary particulars of all male persons born in the year 1926 who have a history of tuberculosis.

The Ministry of Health and the Department of Health for Scotland announce that in view of the influenza epidemic the Ministry of Labour and National Service has agreed to a temporary suspension of the call-up of pharmacists and dispensers to whom an enlistment notice has not already been issued.

The Pharmaceutical Society of Great Britain announces the arrival in this country from North Africa of a cargo of red squill for killing rats. Other shipments are said to be following the first. Our use of medical students. The books were collected as a result of an appeal issued in the medical and lay press by the vice-president of the Students' Representative Council at the University of Valencia. The Association has received the thanks of the Secretary of State for the Colonies for its help to the medical students of Malta. Dr. F. Y. McKendrick, Southland, has been commended for brave conduct when an aircraft crashed and caught fire.

Dr. M. M. Walker, resident medical officer at the Winchester Emergency Hospital, has been appointed to the Colonial Medical Service as assistant medical officer in the Kingston Public Hospital, Jamaica.

Dr. Edward A. Stuecker has been appointed special consultant to the Secretary of War for the Air Forces of the United States Army.

Notes in Brief

They were finally posted to a colliery.

Far as possible this would be done at the training centre before reasons why he was not fit for coal-mining. Arrangements would also be made for men to be medically examined again at a later stage.

Facilities for mass radiography are to be made available in Yorkshire so far as is at present practicable in view of wartime limitations on the manufacture of apparatus required for this system. One unit is being sent to Leeds almost immediately, and another to go to Sheffield within the next few months.

The increases in the number of men over 65 during each of the past two years have been estimated at about 50,000 and 60,000 respectively. Comparable figures for women over 60 are about 93,000 and 102,000, and 2.9%, respectively.

Proposals for providing additional beds for tuberculosis cases in Liverpool by an extension of one of the corporation's hospitals have been approved in principle by the Minister of Health. Plans for the extension are under immediate consideration.

The Pharmaceutical Society of Great Britain has completed arrangements for sending from London a representative collection of 49 volumes to form the nucleus of a pharmaceutical library for the Pharmaceutical Society of China, which, since last year, has its headquarters at Hsinchia, Chungking.

The Spanish Cultural Institute at Buenos Aires has recently dedicated a histological laboratory to the memory of Ramon y Cajal under the direction of Prof. Ortega, one of his pupils.

Dr. Eugenio A. Galli has been appointed president of the National Department of Hygiene of Argentina.

The Ophthalmological Society of Egypt (42, Kasr El Ainy Street, Cairo) has drawn up regulations for the award of a gold medal for the most valuable contribution brought up before its annual congress.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In England and Wales the prevalence of the various infectious diseases changed considerably during the week. Only pneumonia and influenza showed rises in incidence, notifications of the former mounting by 644 cases, and deaths due to influenza increasing by 334 cases to a total of 709. Influenza deaths for the week ending Dec. 11 totalled 1,148. Falls were recorded for scarlet fever, by 463, diphtheria by 122, measles by 67, and whooping-cough by 43.

Influenza.—The largest rises in influenza mortality were those of London from 29 to 72 deaths, and Birmingham from 20 to 57. In Manchester 47 deaths were registered, an increase of 3. The largest totals in the remaining towns were Leicester 19, Liverpool 18, Rochdale 18, Nottingham 17. The greatest rises in the notifications of pneumonia were those of London 83, Middlesex 66, Lancashire 59, Yorks West Riding 58, Essex 56.

Notifications of scarlet fever fell in Middlesex by 80, Lancashire by 68, Yorks West Riding by 54, and in Essex by 36. The decline in diphtheria was fairly general: three counties—Lancashire, Yorks West Riding, and Durham—accounted for 37% of the total notifications. The chief local variations in the incidence of whooping-cough were declines in Yorks West Riding by 56, and London by 30, and an increase in Staffordshire of 30. In contrast to the general trend, the only variation of any size was an increase of 26 cases of measles in Cambridgeshire; they all occurred in Newmarket R.D.

There were 3 fewer notifications of dysentery than in the preceding week. There were no fresh outbreaks of any size, but increases were recorded in existing outbreaks. In Yorks West Riding, Harrogate M.B., the cases rose from 2 to 14, and in Caernarvon, Conway M.B., from 1 to 15. The other principal centres of infection were London 31, Kent 12, Middlesex 10.

In Scotland there were rises in the notifications of acute primary pneumonia 87, and of dysentery 14. Decreases were recorded for scarlet fever 72, diphtheria 27, whooping-cough 20, and cerebrospinal fever 9.

In Eire an outbreak of measles in Kilkenny, Thomastown R.D. 20 cases, was responsible for the increase in this disease.

Quarterly Returns for Eire

During the September quarter the number of births were equivalent to a rate of 22.4 per 1,000 of the population, this rate being 1.5 below that for the third quarter of 1942 but above the rate for the September quarters of the preceding years. Infant mortality was 71 per 1,000 registered births, the highest figure for this quarter during recent years, and was 14 more than the rate for the third quarter of 1942. The general death rate, 12.2 per 1,000, was also the highest for recent September quarters; during 1938–42 the rate varied between 11.4 and 11.7. 551 deaths were attributed to the principal infectious diseases, compared with an average of 344 for the third quarters of 1938–42. The principal causes of deaths from infectious diseases were infantile diarrhoea and enteritis 385, whooping-cough 74, diphtheria 72, the average for the five preceding third quarters being 224, 43, and 44 respectively. Deaths from pulmonary tuberculosis numbered 739 and from other causes 172, compared with 804 and 154 in the September quarter of 1942 and 651 and 166 for the average of the third quarters of 1938–42.

The Week Ending December 11

The returns of infectious diseases in England and Wales during the week included: scarlet fever 2,564, whooping-cough 1,641, diphtheria 634, measles 444, acute pneumonia 2,956, cerebrospinal fever 77, dysentery 166, paratyphoid 2, typhoid 5. The deaths attributed to influenza in the great towns rose by 439 to 1,148.

No. 43

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Dec. 4.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

ANY QUESTIONS?

Serum Sickness from A.T.S.

Q.—A boy aged 5½ cut his foot badly while digging in the garden and was therefore given 2 c.c.m. of tetanus antitoxin. Confirmed irritation and lid oedema in one eye developed within half an hour of the injection, and four or five days later there was a sharp attack of serum sickness. Presumably the immediate reaction was due to immunization against diphtheria four years before, when I believe toxoid-antitoxin floccules were used. What will be the risks if serum has to be given again and how could they be forestalled? Would anything be gained by active immunization against tetanus?

A.—What type of tetanus antitoxin was used? Broadly speaking,

there are three types of antitoxin: (a) Unaltered blood serum of

horses immunized against tetanus. This was in common use many

years ago; perhaps three-quarters of the patients receiving this

suffered from some form of reaction, "serum sickness." (b) "Con-

centrated antitoxin." About 30 years ago it was discovered that

by the use of salt—mostly ammonium sulphate—one could remove

much of the protein of serum without any great loss of antitoxin,

and so "concentrate" the antitoxin. By its use the incidence of

serum sickness was reduced to perhaps 20 to 40%. (c) Enzyme-

and Parfenyev in the U.S.A. described in medical journals methods

of "protein disaggregation" or partial digestion. By treatment with

ferments such as pepsin these authors could get rid of further

relatively useless protein, and alter the antitoxin-containing protein.

The incidence of reaction caused by this anti-

toxin is very low, perhaps 1 to 4%. Teachers in large fever hospitals

often find it difficult now to discover in their wards a single case

of "good serum rash" for demonstration.

Natural antitoxin serum (a) is now of honoured historic interest.

Antitoxin b, owing to early war excess demand, is probably still

in circulation. Antitoxin c has no readily recognizable common

name. Probably "enzyme-treated" would be the best designation;

but titles like "refined," which was at one time applied to b, are

in use. Though c is not entirely devoid of the ability to "sens-

itize" a patient, its liability to do so is so low, and the volume con-

centrating the prophylactic dose is so small, that its use, but for war

emergencies, would have become almost universal. If the doctor

feels compelled ever again to give this boy serum of any kind,

he would be wise to use enzyme-treated antitoxin.

What would be the risk if serum has to be given again? Obviously

a dogmatic statement can be made or rigid rules stated. The

... often quoted for anaphylactic death after serum is about

from their records believe that the incidence is much lower and

that the figure should be in the millions). In some of these fatal

cases there had been a previous history of reaction after serum,

but there does not seem to be any large collection of figures showing

the risk of recurrence of undesirable or dangerous serum reaction.

Most physicians would be chary of giving antitoxin a second time

to a patient with this history. If it became unavoidable, probably

the wisest course would be to inject intramuscularly a small amount

of serum—e.g., 0.1 c.c.m.—and wait a short time, perhaps an hour,

insistently available whenever serum is being injected. Would active

immunization against tetanus be an advantage? The evidence

strongly suggests that active immunization gives a high degree of

protection, though this may not be adequate in all circumstances.

The risk of tetanus in peacetime civil life in England is so small

that it is doubtful if ever a great demand for immunization will

arise, though a recent American writer speaks of the increasing civil

demand there

If the boy is not Schick-negative, prudence would insist that he be immediately immunized against diphtheria with A.P.T. (not T.A.M., or T.A.F.) and tested later to ensure that he is Schick-negative. Also, a "reinforcing" dose of A.P.T. two or three years later would be wise. If permanently Schick-negative, the boy should never need diphtheria antitoxin.

Q.—As a country doctor I meet with numerous wounds, large and small, which may be infected with tetanus. I give a prophylactic dose of serum when I have any fears in the matter. Naturally the same patient turns up after an interval with some new damage sustained on the farm, and perhaps need to have another prophylactic dose of A.T.S. well after the period has elapsed for sensitization to take place. One patient who had such treatment recently developed a very severe rash, with itching, shivering, and malaise, one week later, for two days. She had had two prophylactic injections of tetanus in life, at very long intervals. What danger exists of anaphylaxis in such cases, more especially in those who have had more than one previous injection? Can illness arise after one week or two dangerous, and can it be prevented?

A.—The problem described allows of no completely satisfactory solution. It is conceivable that danger may arise even after the exclusive use of enzyme-treated serum, but experience suggests that it is rare. Even with the old-fashioned salt-concentrated antitoxin, the risk of dangerous reaction and anaphylactic symptoms or even severe muscle have been very small. The present writer (though I cannot trace the record in what the war has left of his papers) once knew of a large hospital in the U.S.A. which, after several cases of diphtheria among the nursing staff, made a practice of injecting monthly prophylactic diphtheria antitoxin into all its nurses. Though these repeated injections went on for a long time, probably with the discovery of active immunization, there had been no serious fatal cases of anaphylaxis at the time the data became available.

Orchitis of Mumps

Q.—If there is substance for the assertion that the contracting of mumps in adult life impairs fertility, what measures, if any, can be taken with regard to this in the diffusion of immunity either from

infecting mumps or from such a result?

A.—Orchitis is the commonest complication of mumps and occurs in 15 to 30% of affected young adults, among whom the infection commonly occurs in epidemic form during wars. As a rule only one testis is affected, but even when both are involved loss of fertility due to testicular atrophy need not follow. Though orchitis rarely the infertility of mumps is low, the abnormal conditions in the Services make it almost impossible for the young adult to avoid exposure during an outbreak. In civilian life the young father should avoid intimate contact with his infected family. Infection is by direct droplet spread during the early stage of the disease. Consequent serum, used as in measles, has given inconsistent results. Any male adult who becomes infected should immediately go to bed and rest for 10 to 14 days in order to lessen the risk of complications. If orchitis develops, usually in convalescence but sometimes earlier or even as the first symptom, the serum is supported with a suspensory bandage, and cold compresses, glycerine of boric acid or lead and opium fomentations, are applied. If the swelling is very pronounced or if both testes are involved, multiple puncture of the tunica albuginea may be done to relieve tension and thus avoid subsequent testicular atrophy. Indeed, for such cases Westphal and Vose (*New Engl. J. Med.*, 1942, 287, 217) recommend exposure of the swollen organ and incision of the tunica albuginea. This gives immediate relief and is followed by a rapid fall of temperature. Operation should be done early before the inflammation has reached its height, but is recommended only for the severe fulminating case.

Q.—I have come across lately several references to oestradiol benzoeate for Dysmenorrhoea

—breasts, distribution of hair, genital fat, clitoris, libido, etc.?

A.—Oestradiol benzoeate is occasionally used in the treatment of spasmodic dysmenorrhoea and sterility, but only when the uterus is to cause increased vascularity and hypertrophy of both myometrium and endometrium. It promotes spontaneous rhythmic contractions of the muscle and increases its sensitivity to other stimuli. Suitable dosage would be 5 mg. intramuscularly every 3 days for 5 doses commencing after a menstrual period. No injections should be given during the 10 days preceding menstruation, but during this time progesterone may be usefully employed as an

A.—Oestradiol benzoeate is occasionally used in the treatment of spasmodic dysmenorrhoea and sterility, but only when the uterus is to cause increased vascularity and hypertrophy of both myometrium and endometrium. It promotes spontaneous rhythmic contractions of the muscle and increases its sensitivity to other stimuli. Suitable dosage would be 5 mg. intramuscularly every 3 days for 5 doses commencing after a menstrual period. No injections should be given during the 10 days preceding menstruation, but during this time progesterone may be usefully employed as an

—breasts, distribution of hair, genital fat, clitoris, libido, etc.?

adjunct. Three courses of treatment over three successive cycles should be given in all. On the whole, however, the results of oestrogen therapy for dysmenorrhoea are disappointing. The effect of oestradiol benzoate on the secondary sex characters is a stimulating one. The breasts may temporarily increase in size and sensitivity, and sometimes the areolae become pigmented as in pregnancy. Sexual feeling and the clitoris, however, are not likely to be affected. The distribution of hair and the figure remain feminine, but the amount of pubic hair, if previously scanty, may be increased.

Recurrent Ulcerative Stomatitis

Q.—A patient aged 24 suffers from recurrent ulcers of the mouth. Duration 3 months. He was treated in hospital: (1) locally, chromic acid 5% and hydrogen peroxide, also arsenical paints; (2) generally, nicotinic acid and ascorbic acid; (3) teeth were x-rayed and two infected wisdoms were extracted. He was discharged from hospital 3 weeks ago with a letter that said these ulcers were incurable and would return from time to time. One ulcer developed 7 days ago. Is there anything more I can do?

A.—Ulcerative gingivo-stomatitis, or "trench mouth," must be distinguished from recurrent aphthous or vesicular stomatitis which goes on to the formation of ulcers or "canker sores." Trench mouth commonly begins in an area of stagnation in the gums, whence it spreads by direct continuity. It is often associated with oral sepsis, and can usually be cleared up by scaling the teeth, removing areas of stagnation, and applying zinc peroxide or chromic acid and hydrogen peroxide locally. The value of intravenous arsenicals is still debated. The aphthous type of stomatitis commonly begins with a crop of small infiltrating aphthae or vesicles, 1 to 2 mm. in diameter, usually surrounded by an intensely red areola. It affects the cheeks, tongue, and pharynx, and the onset is often associated with headache, malaise, and a variable amount of fever and sore throat. The lesions break down and form shallow ulcers which may occasionally by coalescence attain a large size. They may be exquisitely painful. The attacks may rarely be accompanied by simultaneous ulceration of the perianal region and vulva. The aetiology of the disease is unknown, but a herpetic origin is favoured. Cases are sometimes associated with anaemia or agranulocytosis, and may then cease to recur on improvement in the primary disorder. In other cases there is a familial predisposition to the disease. Women seem to be affected more than men, and the recurring attacks may coincide with menstruation. In the past the condition has been extremely intractable, and little but disappointment has come from treatment by removal of foci of sepsis, the use of vitamins, anti-allergic measures and desensitization by protein inoculations or vaccines, attention to the digestion, etc. Local treatment should be carried out with mouth-washes of potassium chlorate (10 gr. to the ounce) or sodium sulphite (1 drachm to the ounce), painting the ulcers with equal parts tincture of myrrh and glycerin of borax, touching them with resorcin 2% in spirit or silver nitrate, or dusting them with benzocaine or chlorotone and boric acid (boro-chlorotone). Very recently, however, Grace (*Arch. Derm. Syph.*, Chicago, 1943; 48, 151) has reported improvement from repeated inoculations of smallpox vaccine. This was given on the assumption that the disease is caused by a virus akin to herpes simplex, which is frequently controlled by the same treatment. The first four or five injections were given at intervals of a fortnight and then the interval was increased to a month; the dose was not stated.

"Spots" in Children

Q.—Many mothers believe that "spots" in children are due to eating fruits, especially apples. Some doctors believe and say the same to mothers. Is there any truth in this belief? If so, how can we explain the absence of such skin trouble in countries where fruit is eaten in enormous amounts?

A.—Many articles of diet, including fruit, are capable of producing "spots" in children, and this reaction has been observed in every country. It should, however, be pointed out that, contrary to popular opinion, food allergy is distinctly uncommon, and that the spots may be due to other causes, such as the itch mite, a common source of error at the present time.

Recurrent Styes

Q.—Can you suggest treatment for a girl of 17 who has been suffering from recurrent styes in both eyes for about a year? She is otherwise very healthy. All the usual remedies have been tried, including argyrol 5%, and albucid, but without avail.

A.—There are two kinds of stye—external and internal. The external stye is a suppurative inflammation of one of Zeiss's glands. It begins as a small painful swelling on the outer aspect of the eyelid; pus develops, and this small abscess points near the attachment of one of the cilia. The infection is staphylococcal, and recurrence may be due to persistence of the staphylococcus on the eyelid or on the hands. An antiseptic cream—e.g., containing 5% sulphathiazole—should therefore be applied morning and night to the eye-

lids and hands for some time after the stye has healed. Sometimes an autogenous vaccine containing in addition staphylococcus toxoid will prevent recurrence, but the foregoing measures to prevent reinfection must not be neglected during vaccine therapy. The internal stye is an infection of a meibomian gland—sometimes called a meibomian or tarsal cyst—and is intensely painful because of the unyielding fibrous capsule. Recurrences are usually in the same site and can only be prevented if the cyst is removed by an ophthalmic surgeon.

INCOME TAX

Official Quarters in Hospital

H. H. has received a demand note for tax on the estimated value of the official quarters he recently had in a hospital. Is this income liable?

* The exemption of hospital premises to income tax under Schedule A does not extend to the value of such portions as are occupied by an individual officer whose total income amounts to £150 or more. This is an old statutory rule and operates not so much by authorizing a charge on the officer himself but rather by leaving liable a portion of tax which would normally be collected from the hospital authority. The tax is due to the Revenue; whether it should be paid by the hospital or the individual officer is a matter for settlement between them. (The entry of the amount due as "land tax" in the demand note is clearly a clerical error.)

Commission for Appointment

C. D. inquires whether commission paid by him for obtaining his present employment as an assistant can be deducted for income-tax purposes.

* No. The payment is not an expense incurred wholly, exclusively, and necessarily in performing the duties of his employment; it is in fact incurred anterior to and in order to obtain that employment. (Such expenses are usually allowed in the case of a medical man holding a series of engagements as a locum tenens, the employment being regarded as continuous over a period notwithstanding the changes in locality and principal.)

Cost of Maid or Work in a Practice

"X. X." now keeps only one maid as the other is working on munitions. When he kept two maids he was allowed the cost of one. What should be allowed now?

* The only test likely to satisfy the income-tax inspector or the Commissioners, if the point is taken to appeal, is in what proportion is the maid's working time divided between work on the professional and private sides. As when two maids were kept it was accepted that a fair division was half and half the same ratio will probably be insisted upon now unless "X. X." can show that the maid still retained spends more time on the professional than on the private side.

Fees received from Medical Board

A. M. is not on any Medical Board but sees cases in a consultant capacity. The local inspector of taxes claims to assess the fees under Schedule E.

* On the face of it there seems to be no reason why the ordinary procedure should not be followed, and the fees accordingly treated as part of the gross income of the practice and included in the Schedule D assessment. If the inspector will not agree, and does not furnish specific reasons for not agreeing, we suggest that A. M. might write to the Board of Inland Revenue, Imperial Hotel, Llandudno, explaining the facts. (On a strict legal basis, the Schedule E assessment may be correct; although not on a Medical Board, A. M. may hold an appointment—i.e., an office of profit—as consultant to one or more such Boards.)

Break in Work owing to Illness

"PATER'S" son qualified in 1940 and was employed in a hospital until January, 1941. Owing to illness he was unemployed until January, 1943, when he started work as an assistant at £25 a month. How should his liability be calculated for the year ending April 5, 1944.

* The "employment" in respect of which liability arises for 1943-4 is his present employment, and should be calculated at the amount of his earnings for the current year—i.e., for the year to April 5, 1944.

Subscriptions

"UPSILON" asks whether he can deduct (a) commission paid to a medical agency for introducing him as an assistant, and (b) subscriptions to the B.M.A. and a medical protection society.

* (a) No; such expenses are incurred prior to and not in the course of the employment. (b) Yes—assuming that membership of these associations is required as a condition of the employment.

Treatment of Tapeworm

Dr. A. GREENWOOD (Godmanchester) writes: I think that we

Destruction of Schistosome Larvae

Dr. F. G. Cawston writes from Durban: For destroying the fragile schistosome larvae there is no more practical remedy than forced dislodgement of the water under pressure, as by a ram, or cart-loads of soil, thrown over rushes on river banks in a dry season, destroy not only, species of *Limnaea*, which depend on light and convey huge infection of stock, but large numbers of the snail-shelled hosts for human parasites. The method deserves to be more extensively employed on farms and villages affected areas.

Colour Film of Air-raid Casualties

night always attracts *Blatta* with deadly effect; specimens will be ready for next morning's dispan.

Back Numbers Wanted

under certain conditions, details of which may be obtained from the manager, Mr. Magill, 17, St. Quintin Avenue, London, W.11.

Some weeks ago we printed an appeal to members who do preserve the Journal for binding to send their copies (preferably) to B.M.A. House, Tavistock Square, W.C.1, addressed to the Secretary of the Journal Board, who will repay the cost of cartage to B.M.A. House. There is a constant demand for it so they need no reminder. There is a constant demand for numbers from libraries, medical institutions, and other sources home and abroad, and each issue goes quickly out of print; but any spare copies published during the war will be welcomed for present purposes and to set aside for the reconstruction of medical and scientific libraries in countries now overtaken by enemy. A member who returns his *Journal* at any time after the Head Office for the benefit of others, including the qualified who are joining the Association in large numbers.

Postural Bizziness

Postural Bizziness

remains constant. Rotation of the head, therefore, produces rotation of the fluid in the semicircular canals, without creating a differentiation of pressure over the sacci. On the other hand, turning a corner on a motor-cycle, a cycle, or on foot may involve a movement of the head only equivalent to that involved in looking over the shoulder, and yet may produce a violent disturbance of equilibrium which requires correction. Any such movement causes differences in pressure over the two sacci, and its automatic correction establishes equilibrium. A slight stenosis or obstruction of the duct leading from one of the sacci to the corresponding saccular nitch would produce the symptoms. On assuming the upright position the change in pressure within the cranium would be conveyed more rapidly from the sacculi to the vestibule on one side than on the other with perservation of the equilibrium on one side than on the other with rapidity from the sacculi to the vestibule on one side than on the other with the patient well forward with the head between the legs for a few seconds and then suddenly sit upright; here will be intense giddiness without any feeling of faintness or change of colour, and the patient may approach the observer and turn up with the utmost rapidity without any giddiness. Looking upwards also is frequently accompanied by rotation of the head about an oblique axis.

1980

Anti-Rabies Care

that I confined my treatment to it alone, one pill three times a day. It tides the patient over the symptoms—depression, flushing.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JULY 10 1943

British Medical Association ANNUAL REPORT OF COUNCIL, 1942-3

Every Member is requested to preserve this Supplement, which contains matters referred to Divisions, until the subjects have been discussed by his Division]

During the year there has been a marked increase in both the central and local activities of the Association. This has been due in large measure to the interest which has been aroused among all sections of the profession by the proposals made in the Beveridge Report on Social Insurance and Allied Services for a comprehensive health service for the community. Further reference to this matter will be found in the section on the future of medical services (see below).

There has been a gratifying increase in the membership of the Association during the year. At the end of 1942 it was 41,239. The figure on June 23 reached the high level of 42,500.

THE ROLL OF HONOUR includes the names of 29 medical officers killed on active service, 26 who have died on active service, and 4 civilian members killed through enemy action. In addition, the Association has to deplore the loss by death of 370 members.

The Association was invited to give evidence to the Interdepartmental Committee on Medical Schools appointed by the Minister of Health and the Secretary of State for Scotland to consider questions relating to the provision for medical education after the war. The Memorandum of Evidence, which was published in the *Journal* on June 5, was submitted to the Interdepartmental Committee in March, 1943.

Mr. H. S. SOUTTAR was re-elected Chairman of Council. During Mr. Souttar's temporary absence as chairman of a commission investigating medical services in India, Prof. R. M. F. PICKEN was appointed Acting Chairman.

The Council reminds members that the emergency conditions have imposed and will continue to impose a heavy burden on all sections of the Association's staff. The Council desires to express its appreciation of the untiring efforts of the officials and the clerical staff in connexion with the work of the Association, the *Journal*, and the Central Medical War Committee.

FUTURE OF MEDICAL SERVICES

The Council reported in its Supplementary Annual Report for 1941-2 that the Medical Planning Commission had issued a Draft Interim Report with the object of provoking discussion and criticism before the Commission proceeded to formulate definite principles concerning the future of medical practice and the organization and reorganization of medical services. The resolutions adopted by the A.R.M. in Sept., 1942, together with the observations of the other bodies represented on the Medical Planning Commission were duly reported to the Commission, which then began to consider its

subject in more detail in the light of the criticisms received.

In Dec., 1942, the report prepared for the Government by Sir William Beveridge on Social Insurance and Allied Services was published. A series of extracts indicating its medical implications was published in the *Supplement* of Feb. 6, 1943. One of the assumptions on which Sir William Beveridge based his social security scheme was the provision of a comprehensive medical service available to the whole population of the country. He stated that the organization of the medical services would need further immediate investigation, but the trend of his thought is indicated in the sentences:

"If a contribution for medical treatment is included in the insurance contribution, contributions will cover not 90% of the population (the present insured persons and their dependants), as is assumed in the Draft Interim Report issued by the Medical Planning Commission, but 100% of the population. This will not, of itself, put an end to private practice. Those who have the desire and the means will be able to pay separately for private treatment, if the medical service is organized to provide that, as they may pay now for private schooling, though the public education system is available for all. But no one will be compelled to pay separately. The possible scope of private general practice will be so restricted that it may not appear worth while to preserve it."

As the issue of the 90% or 100% was of fundamental importance in any planning of future medical services, special meetings of the Medical Planning Commission and of all the relevant committees and group committees of the Association were called to discuss the attitude to be taken by the profession if the Government accepted Assumption B of the Beveridge report. After considering the views of the various committees the Council resolved to submit a motion on the 100% issue to the Special Representative Meeting called for March 31 (*Supplement*, Feb. 13, p. 24).

Before this Special Representative Meeting was held, however, the House of Commons debated the Beveridge report, and the Government spokesman informed the House that the Government accepted, with certain reservations, the assumptions and principles of that report. With regard to the comprehensive medical service, the Lord President of the Council said:

"... This assumption implies the reorganization of the various existing services—the panel practitioner system of National Health Insurance, the existing general and specialized health services of local authorities, the major hospital and institutional services, and so on—and their development into one unified and comprehensive service. By 'comprehensive' I mean, first a service covering the people as a whole, and secondly the inclusion of institutional treatment. ... The Government welcome this conception of

a reorganized and comprehensive health service... the Health Departments will seek the help of those main organizations—local authority, voluntary, or professional—on whose active participation the success of any new reorganization must depend. In consultation with them, the shape of a reorganized service will be worked out, and then the necessary legislation will be prepared. ... The object is to secure, through a public, organized, and regulated service, that every man, woman, and child who wants it can obtain, easily and readily, the whole range of medical advice and attention, through the general practitioner, the consultant, the hospital, and every related branch of professional up-to-date methods. The fullest possible use must be made of existing resources, including existing public services, such as the tuberculosis, cancer, and other services of the local authorities. The idea of the new service must be one of the co-operation of public authorities, voluntary hospitals and other voluntary agencies, and the profession, towards one common end. ... Professional interests, the well-being and integrity of the medical profession, which is not only one of the oldest and most honourable in this country, but on which the success or failure of any scheme will inevitably depend, must be amply and properly safeguarded. The Government recognize that the profession itself is approaching this major reorganization in the progressive spirit which is expected of it. Perhaps most important of all, it is necessary to maintain to the greatest possible extent the principles of free choice of doctor and of the family doctor relationship as the background of general medical practice, and conversely to create the least possible disturbance of existing association between doctor and patient. This need not, in the view of the Government, be inconsistent with the principles of group public practice at well-equipped clinical centres which underlie most of the current thought on the future of family practice. The Government have no intention whatever of forcing the new services on those who continue to prefer to make private arrangements for medical attendance or hospital treatment. Equally, the position of the great voluntary hospitals must be safeguarded."

In pursuance of this promise of consultation the Minister of Health invited the Association to set up, in collaboration with the Royal Colleges, a committee representative of the profession as a whole, to discuss with him the problems and difficulties involved in the establishment of a comprehensive medical service. The Council accordingly formed such a committee under the title of the Representative Committee, and the Medical Planning Commission appointed this same committee as its standing committee to enter into the proposed discussions and to report to it from time to time. The invitation from the Ministry of Health and the constitution of the Representative Committee, which were submitted to the Special Representative Meeting, were published in the *Journal* of March 20 (p. 359).

for medical examination for life insurance. The Council suggested to the Life Offices Association that these fees should be increased by 20%. The Life Offices Association, after having received a deputation from the General Practice Committee, replied that it was unable to agree that at the present time there was any justification for an alteration in the agreement. The Council does not feel that the matter can usefully be pursued further at this juncture.

As a result of action taken by the Council the Ministry of Supply has increased the fees for medical examination of employees under that Department. Following upon pressure by the Council the Ministry of Agriculture agreed to accept responsibility for the payment of a fee of 5s. for the medical examination of recruits to the Women's Land Army.

Certification

The Council is fully aware of the heavy burden placed on doctors by the many certificates now demanded, and the whole matter has been pursued with the various Government Departments. The Council is not responsible for the considerable delay in reaching decisions. A form of certificate has now been prepared by the Ministry of Labour and National Service in consultation with the Association for use in the case of persons who seek evidence to present to their employers of their incapacity for work. Copies of the certificate will shortly be issued to general practitioners.

Appointment of Medical Referees

The Council concluded an agreement with the Ministry of Labour and the Ministry of Home Security which involved the appointment of medical referees whose services may be utilized in connexion with certificates for those claiming to be unfit for the employment to which they are directed by the National Service Officer, or to support an application for permission to leave scheduled employment, or to support a claim for exemption from fire prevention duties. The full details of the arrangements were issued to Local Medical War Committees and published in the *Supplement* (Sept. 12, 1942).

N.F.S. and Civil Defence Personnel

The Council approved a fee of 5s. for the examination of N.F.S. and Civil Defence personnel on the assumption that it applied to routine examination only, and that where a more detailed examination was required a fee of 10s. 6d. would be paid. The Council pressed the Department to define the class of case in which the 5s. and 10s. 6d. fee respectively would be paid, and as a result a statement on the position was published in the *Supplement* of May 29 (p. 65). The Council will review the matter in the light of experience. The Annual Representative Meeting in September last expressed dissatisfaction with the capitation fee (12s.) which had been accepted by the Council for the treatment of certain members of the National Fire Service who were outside the National Health Insurance Acts and were entitled to medical treatment. This question has been raised with the Fire Service Department of the Home Office and is still under discussion.

Fees for Part-time Work for Public Bodies

The Council has considered the following Minute 188 of the A.R.M., 1942:

Proposed by West Norfolk that a new scale of minimum fees be laid down for all part-time work for public authorities, Government Departments, and societies, and that they should be negotiated by the B.M.A. on a national basis.

Resolved: That this matter be referred to the Council.

In the Council's opinion there is no prospect during wartime of negotiating a nationally agreed scale for the services referred to in this Minute. It has been necessary to come to *ad hoc* arrangements with various Government Departments in regard to remuneration for certain services, and the Council does not feel that these arrangements should be disturbed. The matter will be reviewed after the war.

Doctors' Maids

The Council has continued to advise doctors requesting help in connexion with the calling-up or transfer of women employees. Many cases have been referred to the headquarters of the Ministry of Labour, which has promised to give special consideration to any case submitted by the Association where a doctor is experiencing exceptional difficulty owing to the threatened withdrawal of his domestic assistance or to his inability to obtain assistance. In a large proportion of the cases so referred a satisfactory arrangement has been secured.

Towels for Professional Use

When towels were included in the clothes rationing scheme the Council approached the Board of Trade with a view to securing some concession for doctors in general practice or private consulting practice to enable them to maintain a supply of towels for use in their surgeries or consulting rooms. As a result the Board of Trade agreed to issue a supplementary allowance of four coupons for the purchase of towels for professional use. The Association undertook the task of issuing the coupon-certificates to applicants.

Industrial Medical Officers

The Industrial Medical Service Subcommittee has considered, among other subjects, the employment of pregnant women in industry and the methods of recording sickness absenteeism. It has issued to all doctors known to be engaged in whole-time or part-time work in factories the "Memorandum on the Duties of and Ethical Rules for Industrial Medical Officers," which was approved by the Representative Body in 1937. The subcommittee has prepared for the guidance of the office a memorandum on the terms of service for whole-time industrial medical officers.

PUBLIC HEALTH

Fees for Domiciliary Diphtheria Immunization

The Association's present policy for the purposes of local authorities' schemes of diphtheria immunization where the services of general practitioners are utilized is set out in Minute 148 of the Annual Representative Meeting, 1930, and includes a recommendation that the fee per injection should be not less than 2s. 6d., the material being supplied by the local authority. When this scale was drawn up the Council had in mind immunizing injections given at surgeries or clinics; visits to patients' homes were not contemplated. In January, 1943, the Ministry of Health issued a circular expressing the

view that in certain circumstances immunization should be carried out at patients' home. The Council recommends:

That it be recommended to the Representative Body that Section (b) of the scale of fees for diphtheria immunization be amended to read as follows: (b) The fee per injection of immunizing material should be (1) not less than 3s. 6d. where injections are given at the home of the patient, (2) not less than 2s. 6d. where injections are given at the doctor's surgery.

Increase in Remuneration

The Council has considered the desirability of recommending a wartime increase in the remuneration of (a) whole-time public health medical officers and (b) practitioners employed on a part-time basis by local authorities in public health or associated services. In connexion with (a) the Council has expressed agreement with the view of the Society of Medical Officers of Health that no demand for the revision of salaries should be made at the present time, but that any war bonus awarded to the staffs of local authorities should be extended to all medical officers whole-time or part-time.

In regard to (b) the A.R.M. in 1936 approved a scale of remuneration for doctors employed in a part-time capacity by local authorities whether rendering consultant and specialist or general practitioner services at hospitals, clinics, or elsewhere. The Council has decided as a wartime measure to increase by 20% the fees set out in the present scale, and local authorities have been recommended by the Council to increase by 20% the remuneration of practitioners rendering part-time services. The Council's recommendation has been adopted by a number of local authorities.

Attendance under Midwives Act

Representations have been made to the Ministry of Health that as a wartime measure the period allowed a practitioner in which to submit his account for attendance under the Midwives' Act to the local supervising authority should be increased from two to three months from the date on which he is called in.

OPHTHALMIC

The question of increasing the fee for the ophthalmic medical examination of patients eligible under the National Eye Service administered by the National Ophthalmic Treatment Board has been considered. The existing fee of 10s. 6d. is generally felt to be inadequate, but the present is not considered to be an opportune time for the introduction of a higher fee. Active steps are being taken to prepare a scheme for a post-war national eye service.

HOSPITALS

Hospital Staff Committee

The Council considers that in all hospitals there should be medical committees composed of the medical staffs above a certain grade; that where there is a medical superintendent he should be a member or have the right to attend its meetings. The decision as to whether the medical superintendent should be chairman is a matter for individual committees, which should, in any case, have the right of direct access to the hospital management committee. This expression of opinion has been referred to the Medical Planning Commission.

Liaison Committee between B.H.A.
and B.M.A.

In June, 1941, it was suggested that the B.M.A. and the British Hospitals Association should each nominate representatives to form a liaison committee, to be called as and when circumstances required, to consider matters of mutual interest. The Committee has met on two occasions—in January and March this year. The membership is limited to a maximum of six from each side, together with the Secretary of the B.H.A. and the Deputy Secretary of the B.M.A. The following have been appointed as the Association's representatives: Mr. Alec Bourne, Dr. W. Russell-Brown, Dr. J. B. Cook, Dr. J. Ferguson, Dr. P. Macdonald, and Mr. R. L. Newell. Frank discussion has taken place between the two bodies on the application of Assumption B of the Beveridge proposals as it would affect the medical profession and voluntary hospitals. On fundamental principles there was agreement. The Deputy Secretary of the B.M.A. has been appointed as one of the representatives of the liaison committee on the committee set up by the B.H.A. to enter into discussions with the Ministry of Health on a national health service.

SCIENCE

Proprietary Remedies

The Council has considered the following Minute of the A.R.M., 1942:

183. That this meeting views with concern the continued marketing of so-called proprietary remedies of no proved therapeutic value and recommends that appropriate action should be taken by the Association with a view to protecting the public from such exploitation, and that the aims of such action should be: (i) the withdrawal from the market of preparations not proved to be therapeutically active; (ii) the substitution of statements upon the pharmacological action of other preparations for the names of diseases claimed to be relieved by their use; (iii) publication of the formulae of all such medicines in the *British Pharmacopoeia* for the naming of the use of the terminology of the composition, including excipient, of a single dose being clearly stated on every package; (iv) the use of the terminology of the *British Pharmacopoeia* for the naming of official and of the English language for un- official ingredients.

RESOLVED: That this matter be referred to the Council.

In 1939 the Council reported that after a careful inquiry by a conference of members of the Science Committee and representatives of the Pharmaceutical Society, it had reluctantly concluded that for financial reasons it was inadvisable at present to investigate the more reputable proprietary medicines and establish a list of approved products. The Council considers that lack of staff and difficulties of finance make it inopportune just now for any investigation of proprietary remedies by the Association with a view to the protection of the public from exploitation. It may be noted, however, that the Pharmacy and Medicines Act, 1941, though it does not solve the problem of the exaggerated claims made for certain proprietary remedies, has had a beneficial effect by making it obligatory to disclose the constituents or ingredients of products sold by retail and recommended as medicines, and by prohibiting the public advertisement of remedies for Bright's disease, catarract, diabetes, paralysis, etc., etc., locomotor ataxy, paralysis, or other ailments.

Diploma in Physical Medicine

Before the war the Council had under consideration the preparation of a syllabus for submission to the Royal Colleges of Physicians and Surgeons. This work was recently resumed and completed, as it was considered important that arrangements for the establishment of the diploma should be made for the benefit of medical practitioners who might wish to specialize in this branch after the war. The recommendations which the Council has submitted to the Royal Colleges are as follows:

A. That a diploma in physical medicine should be established.

B. That the diploma should be a basic physical medicine diploma, physical medicine being defined as the art of proceeding by physical means to the diagnosis, prophylaxis, and treatment of disease.

C. That the diploma should be open to medical practitioners who are registered in the British Medical Register or possess such qualifications as are recognized by the examining board.

D. That the diploma should be awarded by examination subject to the conditions that the candidate must (a) have held, subsequent to qualification, an appointment as house-physician or house-surgeon at an approved hospital for six months; (b) have completed a special course of study, occupying not less than one academic year and including whole-time attendance for a prescribed period at a recognized hospital or institution.

E. That the syllabus for the diploma should be in two parts—Part I consisting of subjects introductory to Part II, which would require a high standard of knowledge and practice.

F. That the syllabus for the diploma should be:

The Library

The activities of the library have been well maintained despite the loss of skilled staff. Every effort has been made to continue the provision of an efficient library service in circumstances of exceptional difficulty.

Part II

Physical training and remedial exercises, technique, and contraindications.

Medical Electricity, including (a) applications of radiant and thermal methods; (b) apparatus use.

Hydrology: (a) the use of water, internally and externally; (b) the treatment of disease; (c) the use of mineral waters and their therapeutic use.

Climatology: General principles; the factors influencing climate (temperature, barometric pressure, and humidity); their effect in health and disease.

Clinical application of physical methods in the maintenance of health, the management of disease and injury, and restoration to wage-earning capacity.

FINANCE

Enforced economies and the increase in membership have enabled the Association to consolidate its financial position during the past year. When circumstances permit the Association must undertake extensive redecoration and repairs to its House, and in anticipation of this substantial additions to the reserves created for this purpose have been made. It has

Income and Expenditure

The average subscription received in the past financial year was lower than in the preceding twelve months; this is due to the increasing number of members now serving with the Forces. At the close of 1942, however, the membership of the Association stood at a new record of 41,239, so that the subscription revenue has been more than maintained. All the accommodation in the Association's House is now occupied, and the income therefrom justifies the building programme started some years ago.

Apart from the marked decrease in the cost of production of the *Journal*, expenditure was slightly higher than in the previous year. More standing committees have been meeting, and new committees have been appointed. A substantial increase in committee expenditure may be expected during the coming year, and the resumption of local activities will lead to heavier expenditure by Divisions and Branches.

There has been a very substantial reduction in the amount taken from the subscription revenue for the cost of production and issue of the *Journal*; this is almost entirely due to the rationing of paper, which has restricted its size. The total number of pages produced during the year decreased from 4,470 to 3,012, but this was offset to some extent by the increase in the number of copies printed. Although the sales to non-members are restricted the revenue from this source has increased. During the year the price of the *Journal* was raised from 1s. 3d. to 1s. 6d. per copy.

MEDICAL ETHICS

An inquiry has been held into a complaint regarding professional conduct. Divisions for central investigation. The Association on ethical problems has been maintained.

SCOTLAND

At the meeting of the Scottish Committee held in November, 1942, Dr. J. G. McCutcheon (Glasgow) and Dr. A. F. McKillop (Edinburgh) were appointed chairman and deputy chairman of the Scottish Committee for the session 1942-3. On the death of Dr. McCutcheon, Dr. A. F. McKillop was appointed chairman and Dr. George MacFiear (Lanarkshire) deputy chairman. At a special joint meeting of the Scottish Committee and the Insurance Acts

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JULY 17 1943

ANNUAL REPRESENTATIVE MEETING: CHANGE OF DATE

In last week's issue of the *Supplement* it was announced that the Annual Representative Meeting, 1943, would be held on Wednesday, Thursday, and Friday, September 22, 23, and 24. It has now been found necessary to alter this arrangement. The Annual Representative Meeting will be held on Tuesday, September 21, Wednesday, September 22, and Thursday, September 23.

Correspondence

Voicing Opinion

SIR,—Following a Division meeting at Guildford to discuss the B.M.A. resolution in March, I wrote a letter which you were kind enough to publish imploring all my fellow members of the B.M.A. to attend their local meetings whenever the Beveridge plan was to be discussed. On June 27 we held our annual meeting at Guildford, when the very important election of officers was to take place, and I should like again to put forward the same plea; but for this quite different and, I hope, even better reason. I came away from the meeting last March convinced that our affairs were in the hands of impractical idealists, who were handing us over as a political peace-offering to the socialist members of the Government some compensation for the fact that the whole Beveridge plan had not been adopted. I am not going back on anything I said at that time, but another meeting in May and this last meeting in June have made me realize that possibly their ideals may have carried our representatives a little beyond their real feelings, so that others of us may have become a little more realistic than we really are. After all, few of us entered the medical profession merely as a means to a living. As students we all had very much the same ideals, and the interest of our work was our whole interest, for the financial side of medicine had not as yet entered into it. Stern necessity brings that in later, but with 99% of doctors, whatever they may say, it is always second. I have lost many an hour's sleep over a case that has gone wrong, but not one minute's sleep over a patient who has not paid an account.

Two members at this annual meeting said very much the same thing in slightly different ways, which really sums up the whole matter: that at one extreme we have the idealists who are apparently impractical, and at the other materialists who apparently have no ideals; and neither of these can achieve anything. The arguments put forward in March may have appeared to swing the pendulum too far towards idealism, and in May and June the arguments of the materialists may have tried to swing it to the other extreme. We can hope that at the next meeting we may find the pendulum swing-

ing quietly and evenly in between, as a well-balanced pendulum should. The last meeting lasted 3½ hours, but I do not consider that one moment was wasted if the doctors can only get together.

It is my opinion that the question of a State Medical Service should wait for Mr. Churchill's Four-year Plan, but if it must come now, then we must have a united front, so that we can get a square deal for the public and a square deal for ourselves. To my mind a square deal for the public means that all medical facilities should be available to all members of the public, irrespective of their means to pay; but that any man who has saved money has as much right to spend it on medical advice of his own choice as he has to spend it on motor-cars, racing, and luxurious living. A square deal for the doctors is that they should have adequate remuneration in any medical service, and that they should also have the right to private work if they so desire. I think it is of the utmost importance that a doctor should not draw his income from one source only, and that he should not treat one class of patient only, for in these two things we find independence and variety which are the remedy for servility and staleness.

This is the reason that I again appeal to all members of the B.M.A. to attend their Division meetings on this vital crisis, because if members will only voice their opinions in public to the chair, and not mutter them to their next-door neighbour or stay at home and mutter them to themselves, it may be found that most of us are really thinking along very much the same lines. We have always put our patients first, and whatever happens we always shall; but we do not want to be made a pawn in any game of politics. Only two things are necessary:

(1) That every member should attend his Division meetings, unless his professional duties prevent him, and voice his opinions.

(2) That every member of the B.M.A. should point out to his friends who are not members of the B.M.A. the entire selfishness of their outlook in leaving it to others to give their time and supply the funds to fight their battles for them.

—I am, etc.,
Camberley.

LESLIE HARTLEY.

Labour and State Medicine

SIR,—Closely following on the heels of Sir William Beveridge with his plans for control of the medical profession we have a further contribution to the same subject, this time from that hotbed of genius the British Labour Party. After the pompous promulgation of a few truisms about the doctor's place in society, the authors proceed to the main business of the pamphlet—a blunt criticism of general practitioners, their qualifications, and their methods of practice. The attack is fierce and calls for a strenuous defence. It would have been better if the Labour Party before issuing this document had

polished its doctrines into a form somewhat less shocking to good sense and good taste.

What is this strange infatuation which leads politicians to abandon those departments in which they might excel, and start lecturing the medical profession about a subject concerning which they, the politicians, have the very A B C yet to learn? They judge of their theories by the effect which they produce upon their imagination. What they term their opinions are merely their tastes.

Now State medicine is no new thing. It has been in vogue for more than 30 years so far as the industrial millions of the population are concerned. We are surely entitled to ask what the State has done with its powers during the thirty years of control. By its passion for mummeries, its idolatrous adoration of the printed form, and its merciless intolerance, the State has reduced clinical medicine to a shadow of what it should be. If the fruit is now ripening and the thistle bears no figs the fault is not to be laid at our door. The blame is entirely with the Ministry for any shortcomings which the doctors exhibit. Formerly, when a patient came for consultation one inquired about his symptoms; now when a patient comes it is safest to inquire what kind of a certificate he wants and what date he would like upon it. In fact the main reason for the patient coming at all is to get one of these wretched forms.

Instead of being able to practise our art in a calm atmosphere in which we can comfortably permit our faculties to work for the patient's benefit, we have to rush through surgeries of enormous size, and watch all the time to see that no one takes advantage of us. There is a constant atmosphere of suspicion. We sit uneasily balanced between the transcendental on the one hand and the police on the other. This is State medicine in practice. In the laboratory we keep the balance in a glass case so that it shall function properly when we need to use it. In the same way, since truth is only partly attainable, and that with difficulty, a little more regard might be paid to the medical man and the manner of his usage. The main effect of panel practice or State medicine has been the virtual destruction of clinical medicine. Try as we may, the "coarse thumb and finger" of the State intrudes at every turn, insisting upon the letter and denying the spirit.

The family doctor, so the pamphlet says, is "a sickness man rather than a health man," and out of touch with preventive medicine. Here the Labour Party is on very thin ice and should have skated a bit faster. As I see it, preventive medicine includes such things as freedom from accident in pits, freedom from accident on the roads, and above all freedom from accident by weapons of war. All these come under preventive medicine, because by all, health, happiness, and life itself are threatened if not

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JULY 24 1943

MEDICAL EDUCATION AND THE HOSPITAL SYSTEM

In his recent presidential address to the Manchester Medical Society Prof. T. H. OLIVER spoke on the future of medical education, but also brought in some wider issues—namely, hospital regionalization and the comprehensive medical service. He condemned the dual hospital system as illogical and wasteful from various points of view, including that of teaching, for if teaching was always to be associated with voluntary hospitals, and they alone were to be connected with the intellectual centre—that is, the university—a difference in status could be implied (and did in fact now obtain), which in the long run was to the advantage of neither form of hospital. Each class of hospital would tend inevitably to deal with a particular kind of case, and if medical education continued to be confined to the one class it might come academic and unpractical.

Regionalization of Hospitals

Prof. Oliver favoured the regionalization scheme proposed by the Nuffield Trust as the most satisfactory solution to the hospital problem considered as a national one, provided, first, that it was compulsory, and, secondly, that each region was centred around a medical school or university. If a medical school did not exist in any region, one should be created, and he saw no reason why one or more of the schools which, in the national emergency, had been removed from their former quarters into a provincial area should not remain there permanently. Modern transport no longer impelled the segregation of hospitals in large towns as in the past, and hospitals in small urban areas would offer many advantages. The key hospital of the region should contain the medical school and should be allowed a considerable voice in the staffing of the hospitals affiliated to it. It would be responsible for the specialized work of the district, carried on either within its own walls or under its supervision, and at the key hospital also most of the research work would be done. He thought also that each key hospital might well be expected to develop some department which would be distinctive of it, and in that respect serve a larger area than its own region. For it was useless to expect every key hospital to provide very highly specialized departments in every hospital.

The General Practitioner and the Hospitals

The general practitioner, who was intimately concerned with the efficiency of the hospital system, should be represented on the committee, where both municipalities and voluntary hospitals would co-operate in management. While it was not possible for all general practitioners to have contact with hospitals, certain wards should be set apart in the large affiliated hospitals for the treatment of

general practitioners' cases, where hospital supervision could be given along with a certain number of the services available in modern medicine. He also thought that both in these hospitals and in health centres attached to them selected practitioners might be expected to take some part in the teaching of students. In this way the man in general practice would be able to contribute to the education of the practitioner of the future, and, by himself becoming a part of the school, would feel that there was some academic reward for good service.

The Medical Student

The medical student (Prof. Oliver went on) should not go to the university too young, for then his general education would be neglected. He must have a basic training in scientific thought and method. His first two years at the university should be devoted to pre-clinical subjects, and then he should have two years at the key hospital, learning the principles of medicine, surgery, and obstetrics, seeing as much as possible of morbid anatomy in the post-mortem room, and learning something of therapeutics. He should then pass an examination which would license him to practise under supervision. By this time he should be old enough to know his own inclinations, and his teachers should be able to assess his potentialities. If he was destined for general practice he should serve as resident for a further two years in affiliated hospitals, spending his time not only in the medical, surgical, and obstetrical wards but in other departments, particularly the paediatric and fever departments, and also in the health centres. At the end of those two years he should pass a medical examination which would allow him to practise independently. Prof. Oliver suggested that the first examination should be called the M.B. and the second the M.D., so that there would be a practical difference between the two degrees which everyone could understand, instead of a mere academic distinction as at present.

The student destined for a specialism would, after passing the general examination, continue in the chosen speciality in the appropriate key hospital, and return also to the university laboratories for a severe course of training, eventually passing his M.D. or M.S. examination in such a way as to show the speciality in which he had qualified—for example, M.D. Neurology, or M.S. Genito-urinary.

The Economic Framework

Finally Prof. Oliver made some observations on medical service in general. He was opposed to a State Medical Service, but he suggested a compromise whereby health insurance was made compulsory for all, the contributions being graded according to income and responsibilities, as was already done with income tax. The population might be divided, from the insurance point of view, into two classes, the income limit between

them being determined by agreement. The first would correspond to the present insured, the second to those with higher incomes, the latter receiving grants-in-aid, with access to private blocks in hospital, if their illness required such provision, with both general practitioner and specialist services. In this way he believed that both free choice of doctor and some private practice could be preserved, so that, while there must be many more whole-time salaried posts in the hospital service, a medical practitioner would be able to feel that there was alternative employment if, in later years, he wished to be more independent.

A "No Claims" Bonus

Prof. Oliver even suggested the equivalent of a "no claims" bonus on contributions, which would restrain trivial or unnecessary resort to the services. For each of the two grades of insured persons he thought there might be separate contributions—one for actual treatment and the other for investigation—and a bonus return might be made on each. If negligence or misbehaviour could be proved the bonus should be automatically wiped out.

On the wider question of hospital organization and finance, he said that all such reforms would mean some sacrifice of vested interests and to a certain extent the giving up of the independence of individual hospitals; but he believed that in the end hospitals would wish to enter into the orbit of the medical school, which would lead to an upgrading of their efficiency. Even if the hospitals themselves were unwilling, the public would demand it on becoming better educated in medical affairs. Some of the financial difficulties were more apparent than real, and the present cost of salaries and equipment meant that, before long, every voluntary hospital would be compelled to seek aid, either from the Government or from the municipality, if it was to continue to exist at all.

"Many adjustments would have to be made, and the change would require to be gradual, but I believe that a service could be created in which we could preserve our independence, and that eventually the dreamers, both realist and idealist, would find that there was nothing between them—not even a nightmare!"

Some 600 persons were present recently at a very happy ceremony at Earls Colne, Essex, when Dr. T. E. Pallett was presented with his portrait. It was accompanied by an album containing the names of 900 subscribers, and, for Mrs. Pallett, a gold cigarette case. After the presentation there was a reception and dance, to which Dr. and Mrs. Pallett had also invited members of the British and American Forces in the area. Although Dr. Pallett is over 70 he works a full day; he is honorary medical officer of Halstead Cottage Hospital, medical officer to the troops in the district, and a captain in the Home Guard.

of one large county borough which had to decide whether or not their only tuberculosis medical officer should join the Forces. The discussion created a great storm in the council chamber, and the matter was in the end decided on purely party political lines, as was also the rejection of one successor proposed, and the appointment of the one finally selected.—I am, etc.,

Hetton-le-Hole.

R. MACLEOD.

Control by the Profession

SIR,—At yesterday's meeting of the executive committee of the Kesteven Division of the B.M.A. concern was expressed at the inconsequential tone of some of the letters published from your contributors and the apparent lack of realism shown by these in advocating a State Medical Service, and in spite of the decision of the recent Representative Meeting against it. It is strongly felt, in this Division at any rate, that the medical services of the nation must be controlled by the medical profession and not by a bureaucracy, which might be at the mercy of political whims, both centrally and at the periphery. Unity in the profession in the present discussions is imperative, and finagling proposals are extremely dangerous; this important point appears to be overlooked by some practitioners.—I am, etc.,

F. JOSELIN JAUCH,
Hon. Secretary, Kesteven Division.

Doctors and the Future

SIR,—Members of the medical profession, in common with all other reputable sections of the community, have readily accepted the regimentation that they know is a necessary wartime measure. To continue this regimentation after the war period does not seem in accordance with the democratic principles for which the Allies are fighting (see Atlantic Charter, point 3). To thrust these changes upon us at a time when (1) the younger men serving abroad have no proper opportunity of forming or voicing their opinions; and (2) the active doctors left at home are too occupied with professional work to allow them to give their minds fully to other matters, must inevitably arouse bitter resentment at so high-handed a procedure. Are we, or are we not, fighting dictatorships?—I am, etc.,

Bournemouth.

A. BASIL ROOKE.

We have received a copy of the report for 1942 of the Cape Western Branch of the Medical Association of South Africa, which includes reports of the Capetown, South-Eastern, and Drakenstein Divisions, a list of office-bearers, and reports of the Branch's ethical, parliamentary, library, workmen's compensation, and hospital committees. It also includes scales of minimum fees for general practitioners and for specialists. For the session 1943 Dr. R. L. Impey is president, Dr. F. R. Luke vice-president, Dr. B. M. Porter secretary, and Dr. W. L. Hoole treasurer. The planning committee appointed by the Cape Western Branch held some five meetings during the year, and sent memoranda to the Central Planning Committee, which have been extensively used in the drawing up of the scheme for a national health service. Thirteen meetings were held during the year, four of which were clinical evenings. There were two special meetings dealing with National Health Insurance as the policy of the Association, and the attitude of the Cape Western Branch to the proposals for the reorganization of health services. One meeting considered the relations of the Medical Association of South Africa (B.M.A.) to the parent Association.

EXTRA FOODS FOR THE EXPECTANT MOTHER

Doctors are asked to note that a new statement of the Ministry of Food's arrangements for supplying extra rations or priority allowances of foods is now available and is being distributed through local food offices; they should apply for a copy at their local office if they do not shortly receive one. Briefly, the arrangements are as follows:

From July 25, the beginning of the new rationing year, only one medical certificate of pregnancy (R.G. 50) will be required (hitherto doctors have also had to complete certificates for the Board of Trade), on which the approximate date of pregnancy should be entered. On presentation of this certificate at the local food office the expectant mother will receive a child's ration book in addition to her own, which will entitle her to get rather more milk (7 pints priority as well as the normal allowance), extra dried eggs, an additional half meat ration, and the same share of oranges, when available, as holders of R.B.2, and vitamin products as at present. The extra clothing coupons given to expectant mothers will also be available against this medical certificate, and at the local food office, not the public health department as hitherto.

In future, unless the medical certificate states specifically that unsweetened condensed milk is required the sweetened variety will be supplied. Authority to obtain extra supplies of condensed milk will be issued from local food offices immediately on receipt of a medical certificate, and will be for a period of one month, during which time the baby will not be entitled to fresh or national dried milk. If sweetened condensed milk is ordered the child's sugar ration will be cancelled. If in the doctor's opinion condensed milk is required for more than four weeks a medical certificate must be supplied giving details of the infant's condition, age, weight at birth and at time of application, and whether milk or any milk preparation other than condensed milk has been tried and found unsuitable. The local food office will forward it to the medical advisers to the Ministry of Food.

These arrangements for the supply of condensed milk are made to meet the needs of some practitioners. The Food Rationing (Special Diets) Advisory Committee of the M.R.C. considers that condensed milk is an unsuitable food for normal infants and an unnecessary and often inappropriate food in many illnesses of infancy. Its use for infants is permissible only in certain abnormal conditions.

MEDICAL ATTENDANCE ON HOME GUARD

Officers and other ranks of the Home Guard who are suffering from an injury received on duty or from a disability which is regarded as attributable to Home Guard service are, unless they are eligible to receive medical attendance under the National Health Insurance Acts, eligible to receive medical attendance at public expense on the same terms as a soldier of the Regular Army.

Home Guard Regulations provide that, where treatment is not available from military or E.M.S. sources, a member may consult a private practitioner, but on so doing should inform the practitioner at his first consultation that he is a Home Guard member and, in the case of a disability other than an injury, that he claimed that it is attributable to his Home Guard service. He will subsequently notify the Home Guard authorities of his action. In such cases arrangements have been made for Army Form W.4025 to be forwarded by the Territorial Army Association concerned to the civilian medical practitioner giving treatment, and this form will state whether or not the member concerned is eligible for treatment at public expense. Where treatment at public expense is admissible the practitioner, in order to claim his expenses,

will complete Army Form O.1667 and forward this form, together with Army Form W.4025, to the A.D.M.S. of the area or district concerned for settlement as in the case of a soldier of the Regular Army.

In the case of a disability other than an injury in which the Home Guard member fails to observe the instructions referred to above, he will be treated as the private patient of the doctor and will be responsible for the settlement of the doctor's account.

B.M.A.: Meetings of Branches and Divisions

EAST YORKSHIRE BRANCH

The annual meeting of the Branch, which was preceded by a supper, was held at Hull on May 12, thirty-three members being present—a record attendance for this function. Dr. N. GEBBIE, in his presidential address on the doctor and the people, briefly reviewed the important events of the past year, including the publication of the Interim Report of the Medical Planning Commission and the Beveridge report. Dealing with the growing importance of social medicine and the increasing scope of local government, he sketched the trend of health legislation from environmental to personal hygiene, and, recently, to positive health. The inadequate representation of the profession in Parliament and on the committees of local authorities, he said, ought to be remedied before all doctors became State or municipal officials and, as such, ineligible for election.

After Dr. E. M. DEARN was installed as President other officers were elected as follows: President-elect, Dr. C. Simpson; hon. secretary and treasurer, Dr. G. B. Drummond; representative in the Representative Body, Dr. M. B. Coleman. There followed a discussion on matters of local interest and, at the close of the proceedings, a brief meeting of the Branch Council was held.

KENYA BRANCH

The annual meeting of the Kenya Branch was held at Nairobi on Jan. 8, with Mr. C. V. Braimbridge, president, in the chair. The secretary's report for 1942, which was adopted, stated that ten general meetings were held during the year, all well attended, of which three were concerned with problems of sociology in relation to medicine under war and post-war conditions. Dr. Paterson addressed a special meeting on the occurrence of the first case of yellow fever in Kenya. Appreciation was expressed in the report of the invitations issued to members of the Branch to attend the fortnightly clinical meetings at No. 1 and No. 2 General Hospitals; those who had been able to attend had greatly enjoyed their visits. The council had met 12 times and had dealt with an unusually large number of problems, sub-committees being appointed to consider A.R.P., shortage of nurses, maternity services, etc.

Dr. A. J. Jex-Blake is President of the Branch for 1943, and the following officers have also been elected: Vice-president and hon. treasurer, Dr. J. A. Carman; hon. secretary, Dr. F. J. Wright. The president's address at the meeting was on vitamin C. He described the quantitative estimation of vitamin C as practised in the Scott Laboratories, discussed the daily human requirements in health and disease and the importance of vitamins to plants. Quoting from his own analysis, he said that the many Kenya-grown fruits and vegetables examined gave vitamin C figures generally above the averages given in the available tables of reference for other parts of the world.

LINCOLN DIVISION

At the annual meeting of the Lincoln Division held on May 23, Dr. S. Wray presiding, the following officers were elected for the coming year: Chairman, Dr. Wray; hon. secretary, Dr. G. A. B. Walters; representative in Representative Body, Dr. Wray. There was some discussion on the fees charged by the Lindsey County Council to patients who had engaged a private doctor

A.R.M., LONDON, 1943

The Annual Representative Meeting of the B.M.A. will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Tuesday, Wednesday, and Thursday, Sept. 21, 22, and 23, 1943.

APPLICATION FOR TYRE PERMITS

It will help the Regional Petroleum Officers to deal promptly with applications from doctors for tyre permits if doctors will mark the application forms with the word "Doctor" and quote their reference numbers.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. (Temp. Col.) H. Alcock, having attained the age limit for retirement, is retained on the Active List supernumerarily to establishment. The initials of Major G. H. Barry are as now described and not as stated in a Supplement to the *London Gazette* dated June 15.

REGULAR ARMY RESERVE OF OFFICERS

The following Officers, late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers:

Lieut.-Gen. Sir H. Fawcett, C.B., C.M.G.
Lient.-Gen. Major-Genrs. R. B. Alsmuth, C.B.
D.S.O. O.B.E. P. H. Henderson, C.B. D.S.O.
J. F. Martin, C.B. C.M.G. C.B.E. H. P. W. Barrow
Lt. St. A. Maughan, D.S.O. C. M. Drew, D.S.O.
Col. L. V. Thurston, D.S.O. A. C. Hammond Scadding,
M.C. J. F. Meekering, D.S.O. N. Dunkerton,
A. G. Wells, D.S.O. and H. Gall, Clesic, O.B.E.

ROYAL ARMY MEDICAL CORPS

Major D. H. H. Newen-Spence, R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Major J. A. G. Burton, M.C., R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

OM

The following M.O.s have been granted commissions in the rank of Lieut: Majestic A. Billingshurst, Kathleen Downing, Helen S. Fraser, Jean Major, Betty M. Marjess, Elizabeth H. Renwick, Ruth M. Stevenson, Lily M. Williams

MAITABELAND BRANCH

Later a general meeting was held, to which all doctors in the area had been invited. The report on the year's work of the Local Medical War Committee was read by Dr. Ratlow, who paid a warm tribute to Dr. Lyons for his hard work as secretary of the committee. The constitution of the L.M.W.C. in its present form was approved, and Drs. A. Maider and T. O'Brien were unanimously re-elected as members of the committee to represent all the professions in the area. The chairman then read the first report of the Representative Committee, and his satisfaction was expressed that the committee had taken a firm stand on the question of the control of the profession by local authorities.

MAURITIUS BRANCH

The Manhattan Branch held seven meetings during 1942, two being medico-political gatherings. Matters discussed were an emergency medical service for air-raid casualties, regulation of the distribution of opium, quinine, etc. On July 9 Dr. H. Adler, vice-president of the Branch, gave an address on vitamins, paying particular attention to vitamin B, and beriberi, and vitamin B₂ and niacin.

SOUTHERN RAILROAD DIVISION

The annual meeting of the Division was held at Goldsboro on April 25. Dr. Freew presided. Dr. J. H. Hume, Roxburgh, was elected vice-chairman. Dr. D. A. R. Haddon the representative in the Representative Body, and Dr. A. Simpson hon. secretary. A cordial vote of thanks was given to Dr. McWhan for all the work he had done in the past in representing the Division so satisfactorily. After hearing a report from Dr. McWhan, the meeting approved the method of choosing representatives to discuss the proposals put forward by the Ministry. It was suggested that the secretary should write to health officers requesting that adequate attention should be given to the representation of rural practitioners. On the question of medical attendance on the sick poor, it was decided after discussion that the secretary should write to Berkshire County Council requesting that members were willing to contribute £2 per annum for the town or borough and £2 per annum for the parish or village boundary; the scheme to be on this for one year.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JULY 31 1943

Correspondence

1912: Can it Happen Again?

SIR.—I had been one year in practice when the controversy about the part that the medical profession was to play in the working of the National Health Insurance Act blew up. Superficially the attitude of the profession in Leeds, official and individual, was: "We will never surrender." For some time I myself had been aware that doctors had already hinted to their patients that they were going on the panel and were canvassing for prospective panel patients either themselves or through the medium of agents.

At a general meeting of the profession about a week before Mr. Lloyd George's ultimatum expired and the last day for "signing on," I made a short speech. I said that, though I did not feel competent to form a judgment on the wisdom of acceptance or further resistance to the Insurance Act, I was satisfied that the medical profession was beaten not by external forces but by those of internal disintegration. I said that I would not join the panel until the last possible moment and only then if I judged that further resistance was futile. I was not popular for making this prognosis, which was abundantly proved to be correct. A rising consultant who spoke in the same strain for a time ceased to rise at all.

I signed on ten minutes before the list was closed. The clerk to the Insurance Committee said: "You were nearly too late; you might just as well have come sooner"; and he showed me the names of doctors who, though they had in public been bitter and unrelenting opponents of the Bill, had signed on as much as six weeks before.—I am, etc.,

Leeds.

E. WRIGLEY BRAITHWAITE.

Certificates and Compulsory National Service

SIR.—Dr. Avery (*Supplement*, June 26, p. 76) mentions one point about the certificates required by the Ministry of National Service, and the possibility of their being over-riden by the Ministry's officer on the advice of a referee. I think it time that the whole question of these referees, their appointment, and the job they are expected to do should be brought into the light. The posts were not advertised, but the Local Medical War Committees were asked in some cases to nominate suitable practitioners; in other cases practitioners were invited by the Ministry's local officer to take on the job, and the appointment was then brought before the L.M.W.C. for approval.

I have no axe to grind, but it does not seem that this latter method will always secure the best possible referees, while the former method is also rather secretive. Should not these posts be advertised as are those for examining surgeons under the Factories Act, and the appointment made by the local

representatives of the Ministry on the merits of the doctors who apply? If the Ministry does not feel capable of selecting, it could hand over the duty to the L.M.W.C. after the post has been advertised and the advertisement answered.

Secondly, there are grave objections to the policy of the Ministry in sending people to the referee nearest to where the person lives. This usually means that the person is examined by a professional neighbour of the original certifying doctor—a state of affairs which is condemned by the B.M.A. in connexion with the N.H.I. Regional Medical Service. But a still further point against the present state of affairs is that the examination is made in the referee's own surgery. I would suggest that these examinations should be made at a central point selected by the Ministry—e.g., at the Ministry's local office—and that a referee should travel to this office from a reasonable distance so that it would be extremely unlikely that he would have to examine patients of his professional neighbours. In order to help the referee in coming to a decision the applicant should be given a form to be filled up by his own doctor, asking specific questions such as "Can the applicant carry a bucket of water 25 yards?" About ten questions would probably bring all the necessary facts to light and enable the referee to come to a just decision.—I am, etc.,

Bristol.

N. S. B. VINTER.

Travel Facilities for Merchant Navy Officers

SIR.—Some time ago I drew your attention to the fact that no officers in the Merchant Navy with the exceptions of the master and chief engineer were allowed first-class travel when proceeding on leave. I considered this ruling an insult to both surgeons and pursers. A circular has now been issued by the Shipping Federation stating that in future the concession of first-class travel would include chief officers and second engineers but not "other officers." All officers of all H.M. Forces have the privilege of first-class railway travel. Why the invidious discrimination in the case of officers in the Merchant Navy?—I am, etc.,

T. W. ATKINS,
Surgeon, M.N.

* The Secretary of the B.M.A. writes: The Association has already raised the matter with the Admiralty, which referred it to the Ministry of War Transport. The latter informed the Association in a letter dated May 20, 1943, that the present scale for ranks and ratings travelling as passengers confers entitlement to first-class passage only on masters, chief officers, chief engineers, and second engineers, all other Merchant Navy officers being given second-class passages. It is proposed to reconsider this scale in the very near future, and that when this is done consideration will be given to the claims of ship surgeons to be provided with first-class passages.

Safeguarding the Finance

SIR.—Our profession agreed to accept Assumption B of the Beveridge report if the Government decided to enact it, and thus to provide a complete medical service for every citizen. Doubts and dismay have since arisen among doctors from fear lest officialdom infiltrate the profession and engender a servile whole-time service. They were mainly general practitioners at that meeting on March 31, and not only knew they were bowing to the inevitable but were acting as men of good will, aware that the families of insured persons need the care of doctors even more than the insured themselves.

When the National Health Insurance measure was still a Bill, a scheme for including the women and children at a little increased cost to the State was advanced by the doctors centred in Manchester. A thousand signed it. Mr. Lloyd George would have none of it, hardly considered it. The case of the women and children was among the things to come, he said. The scheme provided that by a pool and deposit system the stamps on the cards went to the pool, as now, but that the family was to be the unit, and all its members would enjoy medical benefit with this one check and proviso—that the insured person was to pay for the initial treatment, his own, and that of his dependants, to a limit of liability equal in any year to two weeks' wages. Every insured person was to have a Post Office Savings Bank account into which the insurance system would pay small deductions from his wages. If his deposit exceeded two weeks' wages, he could, if he wished, withdraw the excess; but that amount must be kept in to meet the contingent liability.

Thus there was an incentive not to "go sick"; there is none under the Beveridge scheme. Subconscious malingering will be at a premium, and a substantial minority will fall into the way of doing it. Sir William Beveridge suggests in his report that the doctors must act for the State in watching this. Now, if they act for the State in the matter of preventing malingering will they be family doctors? Under such a system medical practice as the years have built it up will finish. If a primary function of medical men is to safeguard the finance of the scheme, then they must be State servants, whole-time salaried officials, owing their primary duty to the State.

The lately published brochure, which suggests that free choice of doctor and specialist with a salaried service in operation is at all possible therein, is misleading. The advocates of a State service, which is a salaried service, must face the implication of their views, that they spell the end of the family doctor's relation to his patients, which depends on their choice and continued trust, and on freedom to make fresh choice should that trust fail; and upon his acceptance of duty and full responsibility in regard to them. But if this old and tried rela-

A LOCAL VIEW OF STATE MEDICAL SERVICE

tion is of value and is to continue under the Beveridge plan, then the pool and deposit system affords no small financial safeguards to the funds. That system, and indeed applied to 100% of the population, would check the reckless use of the benefit for trivialities and reduce the present enormous cost of short illnesses automatically.—I am, etc.,

LIONEL JAS. PICTON,
Holmes Chapel, Cheshire.

At a recent meeting of the Norwood Medical Society, held to discuss the proposed State Medical Service, and attended by two-thirds of the doctors remaining in practice in the district—of the eleven who did not attend eight are over 60 years of age—the following resolutions were passed:

(1) All questions regarding treatment of medical men under control of this service largely in the hands of National Medical Science, it must leave the State, if the State wishes for a part, we feel that the medical profession are not to be interfered with in their professional activities, and that the State should not attempt to control them in their professional activities.

(7) All administrative medical officers concerned with general practice must themselves have had not less than ten years' experience as general practitioners.

(5) All practitioners on the *Medical Register* on the appointed day shall have a right of entry into the service and also all practitioners subsequently admitted to the *Register*.

(6) For purposes of pension, seniority, etc., in the service, the date of registration shall be counted as the day of entry into the service.

(7) We are hereby opposed to the continuation of the present system.

by logical authorities that are not predominantly medical."

history while in the Forces, application should be made to the "Commissioner of Medical Services, Ministry of Pensions," at the nearest Regional Office of the Ministry (addresses given below). The man or woman's name, unit, and number, with date of discharge (if known) should be given in all cases. It should be clearly understood that any

information furnished by the Ministry is for no other purpose than the doctor's treatment needs of the patient.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY AUGUST 7 1943

British Medical Association

SUPPLEMENTARY ANNUAL REPORT OF COUNCIL, 1942-3

Every member is requested to preserve this SUPPLEMENT, which contains matters referred to Divisions, until the subjects have been discussed by his Division

PRESIDENT OF THE ASSOCIATION, 1943-4

Sir Beckwith Whitehouse was elected by the Annual Representative Meeting at Aberdeen as President of the Association, but owing to the war situation he did not assume office until the Annual Meeting in 1942. The Council now proposes that Sir Beckwith Whitehouse should be re-elected as President and recommends:

Recommendation: That Sir Beckwith Whitehouse be elected President of the Association for 1943-4.

[The Council deeply regrets that shortly after the meeting of the Council at which this Recommendation was made Sir Beckwith Whitehouse collapsed and died.]

FUTURE OF MEDICAL SERVICES

The Council outlined in its Annual Report the events leading up to the appointment of a Representative Committee, to explore, in discussion with the Minister of Health or his officials, the medical problems raised by Assumption B of the Beveridge report, and to put forward to them the views which were believed to be those of the majority of the profession. It had no power to commit the profession to any policy or undertaking in any way whatever. The discussions have now concluded; and the Representative Committee has presented a confidential report to its constituent bodies, including the British Medical Association. The report has been considered by the Council. In its discussions with the Ministry the Representative Committee was guided in general by the B.M.A.'s *General Medical Service for the Nation*, the Draft Interim Report of the Medical Planning Commission reviewed in the light of the criticisms and observations made by the constituent bodies of the Commission, and the general principles which will be mentioned below.

The Minister intends shortly to issue a White Paper surveying the position. It will in no way commit the medical profession. The Representative Committee urged upon the Minister that the White Paper should be confined to a statement of the problems and not commit the Government to any one solution of those problems. In this way there would be facilitated a free and frank discussion of problems by the public, by the profession, and by other affected groups.

The Representative Committee reported that, on the Ministry's ruling, the discussions were confined to the consideration of a comprehensive health service available to the whole community. They ranged over a wide field of subjects, such as central and local administration, health centres, free choice of doctor,

private practice, and methods of utilizing the services of medical practitioners, including methods of remuneration. Though the Committee did not in any way commit the medical profession, it reached the conclusion that there should be an early statement by the profession of the fundamental principles that should form the basis of any future reorganization of health services, whatever the contents of the White Paper.

The Council is in agreement with this view, and, after consideration of the general principles enunciated by the Representative Committee, it submits the following recommendations for the consideration of the Divisions.

Principles

Recommendation A: That the Representative Body reaffirms the following basic principles laid down in the Association's *General Medical Service for the Nation* approved in 1938:

(i) That the system of medical service should be directed to the achievement of positive health and the prevention of disease no less than to the relief of sickness.

(ii) That there should be provided for every individual the services of a general practitioner or a family doctor of his own choice.

(iii) That consultants and specialists, laboratory services, and all necessary auxiliary services, together with institutional provision when required, should be available for the individual patient, normally through the agency of the family doctor.

(iv) That the several parts of the complete medical service should be closely co-ordinated and developed by the application of a planned national health policy.

Recommendation B: That the health of the people depends primarily upon the social and environmental conditions under which they live and work, upon security against fear and want, upon nutritional standards, upon educational facilities, and upon the facilities for exercise and leisure.

Recommendation C: That the efficiency of a country's medical services, both preventive and curative, depends upon the available medical and scientific knowledge, upon the character and extent of medical education, and upon the absence of any economic barriers that impede the utilization of such services. Thus, in order to improve the country's medical services, the facilities and resources for medical research should be greatly increased and methods devised for their adequate application; medical education, both undergraduate and postgraduate, should be maintained on a high standard and be adapted to modern needs; the facilities for postgraduate medical education should be greatly increased; and wherever economic barriers

prevent an individual taking advantage of medical services such barriers should be removed.

Recommendation D: That, subject to these general and overriding considerations, the functions of the State should be to co-ordinate existing provision, both official and non-official, to augment it where necessary, and to secure that it is available without economic barrier to all who need it. The State should confine itself within these wide limits, invading the personal freedom of both citizen and doctor only to the extent which the satisfaction of these functions demands.

Recommendation E: That the State, while assuming responsibility for the organization and provision of medical services, should not assume control of doctors rendering individual or personal health service. It is not in the public interest that the State should convert the medical profession into a salaried branch of central or local government service.

Recommendation F: That free choice of doctor should be preserved as a basic principle of future health services, and no administrative structure should be approved which does not both permit and encourage such free choice.

Recommendation G: That it is not in the public interest that the State should invade the doctor-patient relationship. The loyalty and obligation of a doctor rendering personal health service to an individual patient should be to that patient and to none other.

Recommendation H: That free choice of doctor should be reinforced by a method of remuneration which relates remuneration to the amount of work done or the number of persons for whom responsibility is accepted.

Recommendation I: That every member of the community should be free to consult the doctor of his choice either officially, as when he consults the doctor he has selected under an official service, or privately, as when he consults some other doctor, whether that doctor is a member of an official service or not. Nothing should be done to encourage the splitting of the medical profession into two groups—the official doctors and the non-official doctors.

Recommendation J: That consultants and specialists should normally be based on the hospital. For those persons who wish to be treated in private accommodation, whether part of a hospital or not, private consulting practice should continue as at present.

Recommendation K: That the central administrative structure set up by the State for the central administration of the medical service in the future should be a body concerned only with civilian

SUPPLEMENTARY REPORT OF COUNCIL

20 AUGUST 7, 1943

health services, but it should be responsible for all administrative by central government. The Minister to whom this central administrative body is responsible should be advised on medical matters, including personnel, by a medical advisory committee, representative of the medical profession. Locally, new administrative bodies, responsible to the central authority, should cover wide areas and indirectly, directly or indirectly, in approval of the community served and, in approval of the local medical profession. They should be represented on medical matters, including personnel, by local medical advisory committees representative of the local medical profession. These administrative changes should be registered as foundation changes to be completed before other changes are initiated.

Recommendation 1: That all branches of medical practice should be regarded as a single service, and it is undesirable that a detailed scheme for general practitioners should be framed and put into operation without corresponding arrangements of practice.

Immediate Proposals

the public also—that the Association been hard at work on these problems since 1928, and that certain principles were succinctly set out in the proposals for a General Medical Service for the nation, last published in 1938, and (except for one paragraph irrelevant in the present connexion) unanimously adopted by the Representative Body in that year. He was sometimes alarmed when he found people writing in the *Journal* that though nothing need be done to improve the medical services of the country, this was not the policy of the Association which had endeavoured to devise an improved medical system, and had merely been driven into it because William Beveridge and the Minister Health had taken action.

It was agreed that a reaffirmation of the four basic principles laid down by the Association in 1938 should stand at the head of the document.

The CHAIRMAN pointed out that not only had a number of the ideas of the Medical Planning Commission been adopted by official planners but even its language had in part been taken.

Discussion arose on the inclusion of the word "rehabilitation" ("a comprehensive health and rehabilitation service"). It was felt that the word in this connexion might be misconstrued and the narrow meaning of refitting for industry, and the Council decided that the phrase "a comprehensive health service" was sufficient.

Control in the New Service

Dr. P. ISWALD raised a question on paragraph (v), which stated that, while the State assumed responsibility for the organization and provision of medical services, it should not assume control of doctors rendering individual or personal health service. Was the Government to be asked to provide the money and to "orgo control"? The CHAIRMAN said that he intended meaning was that the State should not interfere with the doctor in the pursuit of his professional avocations. There should be no dictation to the doctor, and the PRESIDENT pointed out that in the case of universities the Government did provide money but delegated the control. Mr. ZACHARY COPE said that the control referred to in the paragraph was complete control, not incomplete control as instanced in the function of an advisory body.

It was proposed that in order to make it clear the word "professional" should be inserted before "control" should not assume professional control. Dr. H. G. DAIN argued against this amendment. They were trying, he said, to arrange a service for the whole of the individuals of this country, and in doing so to retain freedom of choice for doctor and patient. The qualification of the word "control" would suggest that a giving service to an individual they must necessarily be under some control. Other members considered the word "professional" to be ambiguous, and the proposal to introduce it was negatived. In the next paragraph, which urged the free choice, Dr. DAIN said:

On the next paragraph, which urged the encouragement of free choice, Dr. W. W. Fox asked what was meant by such encouragement. Dr. F. W. GRANT considered that it was well to use the word because the great discourager of free choice up to now had been the Government. The CHAIRMAN said that it was a very old principle of the Association which was

paragraph was adopted without amendment. FARNALD also took objection to the high emphasized the

Dr. INWALD also took objection to the next paragraph, which emphasized the loyalty of the doctor to the individual patient and to none other. He thought this was a narrow view. Circumstances might arise in which their loyalty to the patient militated against the community. The CHAIRMAN said that loyalty to the patient as taking precedence of any other loyalty had always been accepted by the profession.

The Doctor of the Patient's Choice

A good deal of discussion took place on paragraph (ix). Dr. NOEL WATERFIELD wished it to be made clear that a member of the community had the choice not merely of doctor but of the terms on which he was to be treated—that is to say, whether as a private patient or a patient in an official health service. Dr. DAIN thought that to alter the paragraph might make difficulties. It was obvious that the principle that a doctor should be paid twice over for the same patient could not be maintained. Dr. WATERFIELD thought that the precedent was set by the "own arrangements" method in National Health Insurance. Eventually a clearer form of words than that originally employed was arrived at and adopted on the motion of Dr. O. C. CARTER, seconded by Dr. DAIN:

member of the community, to be doctor of his choice.

"Every member of the community to be free to consult the doctor of his choice, either officially, as when he consults the doctor he has selected under an official service, or privately, as when he consults some other doctor, whether that doctor is a member of the official service or not. Nothing should be done to encourage the splitting of the medical profession into two groups—the official doctors and the non-official doctors."

Immediate Proposals

Dr. INSWALD, in referring to section 6 of the report, which laid it down that Assumption B of the Beveridge report would be satisfied, so far as was at present practicable, by an extension of National Health Insurance, asked how this resolution could be squared with the statement of the last Annual Representative Meeting that the new service should not be an extension of National Health Insurance.

SECRETARY (Dr. Anderson) said forward by the

The SECRETARY (Dr. Anderson) said that the questions put forward by the Medical Planning Commission were in the form of three suggestions. One of these was the simple extension of National Health Insurance to dependants and others and the widening of the scope of its service, and this was turned down by the Representative Body, but only in favour of another of the suggestions, which again was the two-way extension of National Health Insurance but plus certain other administrative changes.

It was pointed out that the Representative Body did vote in favour of the two-way extension method as an immediate and interim measure. Dr. DANI suggested that whatever was done at the Annual Representative Meeting on the last occasion there was no objection to putting forward new proposals.

The paragraph without amendment in this respect. Dr. J. G. THWAITES thought that a reference should be made at this point in the document, not only to what the B.M.A. had proposed but to what it had actually done, as, for example, in the institution of Put

It was agreed that a reference of this kind should be incorporated. Prof. PICKEN said that personally he did not like the suggestion in the Beveridge report that the function of the medical profession was to protect an insurance fund by a sort of deterrent certification. The interest of the profession was in the well-being of its patients, not in bolstering up a fund. The Council generally agreed with this view, but it was thought that the present document was not an appropriate place in which to express it. The report as amended was then unanimously agreed to.

The Negotiating Body
Dr. WAND suggested that there should be remitted to some committee the consideration of the setting up of the negotiating body now that the stage of discussion had been concluded. The method whereby the Representative Committee for discussion with the Ministry had been set up had given rise to objection in some quarters, and it would forestall objection with regard to the negotiating committee if early consideration were given to this point in time to give the necessary information at the Annual Representative Meeting. The proposal was agreed to, and the Executive Committee was asked to undertake the matter.

The CHAIRMAN said that the Annual Representative Meeting in September would not be able to consider the White Paper. That would necessitate the calling of a Special Representative Meeting later on, and it would presumably be at that meeting that steps would be taken to form the committee.

THE FUTURE OF PSYCHIATRY
The Council had before it a report on the future of psychiatry, recently adopted by the Psychological Medicine Group. The report was prepared primarily for the information of the Representative Committee, but there was also a suggestion that it might be published as an Association "grey book," as it was a supplement to a previous report of the Mental Health Committee, which was now to some extent out of date. Three members of the Group Committee attended the Council to present the report—namely, Dr. Noel H. M. Burke, Dr. Millais Culpin, and Lieut.-Col. A. A. W. Petrie. PETRIE said that the report was

Col. PETRIE said that the report was the considered judgment of a large number of psychiatrists, who had held two conferences on the subject, each of which had an attendance of about sixty. The report embodied a number of compromises, but it did represent a general view.

Dr. H. G. DAIN asked whether this report had been submitted to bodies of medical men other than psychiatrists. Had the views of practising physicians and surgeons been taken into consideration in drafting the document? It seemed to him, to a large extent, to take psychiatry out of medicine, and to suggest that physicians and surgeons and general practitioners did no psychiatric work at all.

PETER MACDONALD thought that the report should be given to the Association.

Dr. PETER MACDONALD thought that more consideration should be given to the document before it became an Association "grey book." He criticized certain paragraphs, notably the statement that alcoholic addiction did not call for any unusual methods of treatment. One treatment for alcoholism was subtoxic doses of atropine and strychnine; another was hypnotic suggestion. Were

AN APPEAL FOR BACK NUMBERS

H.M. Forces Appointments

Members who do not preserve their copies of the Journal are invited to send their copies (preferably in bulk) to B.M.A. House, addressed to the Secretary of the Journal. The cost of carriage will be repaid. There is a constant demand for back numbers and each issue goes quickly out of print; hence any spare copies published during the war will be welcome. The steady growth in membership to a figure well above 43,000 has increased the circulation of the Journal by 12% in the past four years, because every new member must have his own copy. Every means of economizing space has been adopted in order to make the paper ration go as far as possible, and nothing more can be done except to reduce the number of pages still further. A member who returns his copies at any time after reading them will in that way put them back into circulation through the Head Office. If the response to this appeal is widespread the help thus given will be very material at a time of great and increasing difficulty.

On the motion of the Chairman of the Scottish Committee the Council authorized work in connexion with the preparation of a report upon the local administration of health services. It was also agreed to vote £250 to the Northern Ireland Branch for secretarial and less generous than in Great Britain. Mr. Zachary Core presented recommendations upon the Science Committee, following upon resolutions in the Physical Medicine Group Committee, the Council expressed the opinion that during the clinical years of the curriculum physical medicine should be an integral part of the instruction in the therapeutic. This opinion is to be conveyed to the deans of medical schools, the General Medical Council, and the Committee of the Royal College of Physicians on the future of Medical Education.

A matter which was referred to the Council by the last Annual Representative Meeting concerned the advisability of further investigation and research as to possible danger from respiratory obstruction under anaesthesia. The opinion of the Anaesthesia Committee of the Medical Research Council was that research was of extreme rarity, and that research into the condition would be very difficult and probably fruitless. All that seemed necessary was, by means of a note in medical publications (such as a note in *the British Medical Journal*) to give further publicity to the already appeared in the *British Medical Journal*. It was agreed that no further action be taken at present.

OTHER BUSINESS

On the motion of the Chairman of the Scottish Committee the Council authorized work in connexion with the preparation of a report upon the local administration of health services. It was also agreed to vote £250 to the Northern Ireland Branch for secretarial and less generous than in Great Britain.

Dr. F. M. B. Allen, the representative of the Branch on the Council, said that the Government of Northern Ireland had been obtained from the Government of that country. Dr. F. M. B. Allen, the representative of the Branch on the Council, said that the Government of Northern Ireland had been obtained from the Government of that country.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY AUGUST 14 1943

Correspondence

Special Representative Meeting

SIR.—The *Supplement* of July 24 contained a letter, with 17 signatures attached, which is, in the main, an attack on me for my conduct in the chair at the Representative Meeting of March 31. The accusation made is a serious one. It is, in fact, that I abused my position as chairman of the Representative Body to frustrate the activities of some at least of the Divisions of the Association and of their Representatives. Conscious as I am of my demerits for the post of Chairman, I felt assured that Representatives generally would recognize that this was not conduct of a kind of which I am capable, and my first reaction to the letter was to leave the answer as that in the footnote you attached to it, in which the Secretary of the Association explained the course of the Representative Meeting; but on consideration I decided that I must make my own reply.

The following are the facts:

1. The Meeting of the Representative Body was a special one. By-law 46 of the Association provides that: "No business shall be dealt with by a Special Representative Meeting other than that for which it is specifically convened."

2. Some of the resolutions sent up by Divisions did not comply with this, and at the beginning of the meeting I pointed this out, and that such resolutions were out of order.

3. On a few other resolutions I was not quite clear whether they complied with the by-law or not, and I proposed to deal with these as they arose.

4. At the joint meeting of the Representative Body and the Panel Conference held in the morning of March 31, a resolution evolved which was passed as a recommendation to the Representative Meeting, and it constituted an amendment to the resolution of Council, which was the subject-matter for consideration by the Representative Meeting in the afternoon.

5. I spent the luncheon interval in considering this amendment and its effect on the various amendments sent up by Divisions. I decided that it was a valid amendment, and, accordingly, I took it as the first amendment, and I did so with the assent of the Representative Body.

6. I thought it likely that some of the Representatives might not grasp the significance of passing this amendment, and that this was so borne out by the failure of the 17 signatories to do so.

7. I therefore went out of my way to point out to the Representative Meeting that acceptance of this amendment would make it the substantive resolution for the meeting.

8. I pointed out that if it thus became a substantive resolution the great majority of the amendments sent in by Divisions

would become irrelevant and would fall to the ground.

9. It was not part of my duty so to guide the Representative Body: I went out of my way to do so, and I did this before the amendment was considered.

10. The amendment was passed. It became the substantive resolution, and most of the other amendments on the agenda paper fell to the ground, and they fell to the ground as the result of the deliberate action of the Representative Body.

As I have indicated above, I am conscious of my many demerits for high office in the Association, but I am confident that when the facts about this meeting are known, even the signatories will agree that my conduct in the chair was neither "autocratic" nor "unconstitutional." I am, further, ready to maintain that the conduct of Council in the present crisis is not "autocratic" or "unconstitutional" any more than my own in the chair of this Special Representative Meeting.—I am, etc.,

York.

PETER MACDONALD.

Second Thoughts?

SIR.—The following is an extract from the speech of Mr. Ernest Brown, Minister of Health, at the recent conference of the National Liberal Party:

"There ought to be no personal troubles. The friendly personal relations between those who have differed should make discussions easy. We attach the utmost importance to a concerted and effective attempt to give free enterprise and initiative full play in the broad sweep of all our national plans. We believe that complete State control of industry means the end of spiritual and civil liberty. On Liberals will fall a large share of the post-war struggle for the restoration of the people's liberties. If any major control was to be continued it must be justified to the last decimal point."

Does he believe that State control of medicine would be any less calamitous or is this just another example of the divergence between party propaganda and Ministerial intentions?—I am, etc.,

London, N.15.

IVY M. TUCK.

State Salaried Medical Service: A Problem of Man-hours

SIR.—A matter which is of vital importance for the consideration of every doctor, and one, moreover, that so far has received but slight consideration in all the correspondence on State salaried service, is the problem of man-hours. Some doctors, like the Minister of Health in his recent proposals, advocate the adoption of a salaried service immediately after the war. Can it be done?

A complete change of system can only be justified if considerable benefits are to be achieved. The advocates of a salaried service claim it will benefit both public and doctors alike. This raises the question: How can the public have more service and the doctors more leisure with-

out first a large increase in the number of doctors? The work already being done by doctors will remain to be done, for no new system will suddenly banish sickness from the land. Such minor time-saving economies as may result when health centres are established (and they won't be built in a day) will be countered by time taken making official returns, dictating notes to recording clerks, and so on. At the same time, many additional duties will be imposed on doctors in order to supply the increased services promised to the public. Statistics are difficult to obtain, but great care has been taken in collecting the following figures (many of which are taken from pamphlets issued by associations advocating a salaried service). Their implications are illuminating and vital.

1. The pre-war distribution of doctors was as follows:

(a) General practitioners: panel	19,000
(b) General practitioners: non-panel	4,000
(c) Consultants and specialists	4,500
(d) Hospital doctors (full-time)	4,500
(e) Local authority (non-hospital service)	2,000
(f) Government service	600
(g) Ire and	3,700
(h) Abroad	11,000
(i) Services (active and retired)	3,200
(j) Retired or not practising	6,000
(k) Unclassified (probably not practising)	2,300
	61,000

It should be noted that doctors for a salaried service in Great Britain could only be drawn from the 34,800 in sections (a) to (f).

2. The average conditions pre-war for a general practitioner with a full practice, panel and private, were:

Average working week throughout the year (excluding night work) 54 hours. Days off yearly for holidays and sick-leave 18 days.

Man-hours performed yearly = $(365 - 18) \times \frac{54}{7} = 2,677$ man-hours.

3. It is assumed that in a salaried service conditions will be comparable to those of civil servants of like status. Pensioning is estimated to reduce professional life by no more than 1/52nd—that is, the equivalent of seven days a year (some doctors already retire early; others do not live to pensionable age). The suggested arrangement for night work is that at a health centre housing ten doctors each man would do one night in ten on duty and would have half the next day off duty. This reduces the availability of each doctor by four hours every ten working days—in other words, by eighteen days a year.

Average working week throughout the year	48 hours
Annual holidays (civil servants have more)	25 days
Average study leave yearly	7 days
Average sick-leave	7 days
Pensioning (as above)	7 days
Night rota (as above)	18 days

Man-hours performed yearly = $(365 - 67) \times \frac{48}{7} = 2,029$ man-hours.

Correspondence

Freedom or Control?

SIR,—The real issue confronting the general practitioner is whether he wishes to retain his freedom or become a civil servant under some form of local or central government authority—i.e., freedom or control? The index of opinion in S.W. Surrey (*Supplement*, June 26, p. 75) shows that 96% desire to retain their freedom. This is the only issue which affects the G.P. and constitutes the fundamental principle upon which we must make our stand. The problem of private practice should be divorced entirely from other issues which do not concern the G.P. (consultants have their own specialist groups in the B.M.A.). The important spheres of medical work may be grouped as follows: (1) Hospitals and "facilities"; (2) public health; and (3) private practice. It is essential that we should examine the relationship of the general practitioner to these groups.

(1) *Hospitals and "Facilities"*.—The problem here is one of co-ordination and co-operation of public and voluntary hospitals and their facilities. This is purely a matter for negotiation between the public authorities and the management committees of the voluntary hospitals. It is an old problem which started with the passing of the Local Government Act, 1929, and the Minister of Health is at present negotiating with the representatives of these bodies. This has not anything to do with our problem—the threat to regiment the profession under State control.

(2) *Public Health*.—If the planners honestly desire to improve the health of the nation they should attend to the really important factors in the attainment of this objective—housing and sanitation, factory conditions, hours of work, minimum wage standard, etc. These are matters of environmental health—the field of the P.H. officials—and not primarily the sphere of the general practitioner.

(3) *Private Practice*.—This is the only section which concerns us. The overwhelming majority are opposed to a State Medical Service and to any further encroachment upon their freedom. The Socialistic planners want to control this free profession, secure its services at a low rate of remuneration, and, above all, to control certification. (Dr. Hill: "Why the hurry? It was necessary to control the medical profession so that certification could be controlled.") That we must be prepared to fight for our freedom is evident from the following extracts from the Beveridge report: "The possible scope of private practice will be so restricted that it may not appear worth while to preserve it" (p. 160). "The report proposes a compulsory social insurance scheme without income limits" (p. 159).

And the first step is to define the fundamental principle for which we are

fighting—freedom. We should not allow this to be clouded by muddling issues—e.g., group practice, access to consultants, etc.—all of which presuppose some sort of "scheme." Clear definition of the fundamental principle of the majority opinion is the essential preliminary to the attainment of unity.—I am, etc.,
Guldford. J. O. M. REES.

State Provision without Control?

SIR,—To the vast majority of the medical profession, consisting as it does of exponents of individualism, the word State is anathema, conjuring up a picture of a characterless machine in which the individual loses his identity. Dr. Charles Hill, in the reported address "Medical Practice: In the Melting Pot?" appears to make use of this reaction in order to urge the conservation of private practice. He says that "the function of the State might be taken as the organization and provision of medical services. But this did not involve the assumption of control over doctors rendering individual or personal health service." This is a refreshing ray of light in the gloom of envisaged civil "servicedom"; but, if true, surely Dr. Hill's next sentence, "Provision where necessary should be the keynote of the State's activity," is a glaring *non sequitur*. Had he said "Control only where necessary . . ." then none would demur, for all are agreed in disliking bureaucratic control, but there are many members of the profession who do not want private practice retained, with its retail selling of their services across the counter of the bedside or consulting-room table.

It is to be hoped that the Representative Committee will not make too much of the desire to retain private practice for the profession, but will concentrate its efforts on the major point of discouraging unnecessary interference by the State in the medical aspects of the doctor-patient relationship. Let us beware lest in straining at the gnat of private practice as to 10% of the population we swallow the camel of bureaucratic control as to 90%.—I am, etc.,
Ipswich. W. P. GRIEVE.

Rotherham's Views on State Medical Service

SIR,—With your permission I would comment upon the letter of Dr. A. C. E. Breach (*Supplement*, July 24, p. 14). If he is convinced that a State Medical Service is not in the interest of the public and the profession then his opening remarks are a counsel of defeatism, and his problem is not, Can he rely upon 95% of the profession refusing service? but, Can he rely upon himself to do so? The answer is, presumably, No!

If he is in favour of such a service, it is a pity to prejudice his concluding proposals by the false assumption that all those who have followed the recent discussions have so little faith in themselves and their colleagues that they must now give up opposition to State service.

It may interest your readers to know the result of a questionnaire recently sent to all medical men in the Rotherham area. Sixty men were contacted, including public health doctors, hospital staffs, and G.P.s. Forty-eight completed replies were received. It is worthy of note that of the 12 not replying the majority were the younger men of the district. Of the 48 replying, 42 were against a State Medical Service as proposed by the Government, and 40 declared themselves ready to refuse service if conditions unacceptable to the profession were forced upon us. Of the 17 doctors now engaged in salaried service—public health, hospital, or assistants in general practice—only 3 voted in favour of a State service. A majority favoured an extension of the N.H.I. Acts to cover dependants of insured persons.—I am, etc.,

Rotherham.

ALAN TAYLOR.

Medical Certification Boards

SIR,—Dutiful attendance at Study Group, B.M.A. Division, Panel Committee, and many other meetings, together with assiduous reading of letters and editorials in the *Journals* and other pabulum, have left in a naturally rather woolly mind very few clear notions of what is desired by the medical profession or the Ministry as to the shape of things to come. It even seems doubtful whether the profession is a sufficiently coherent organism to agree on any policy, unless it is that pursued at the inception of National Health Insurance—namely, to wait and see what the Government will hand out to us, and then to dig in our heels with loud cries of protest, as a preliminary to yielding rather ungracefully all along the line.

It does, however, seem fairly clear that the powers that be are likely to impose a considerable measure of regimentation on the general practitioner at any rate, and that this is opposed by a considerable proportion of them, although undoubtedly welcomed by some. The impression is also widespread that one of the most cogent motives for putting us under the yoke lies in certification in its financial relation to an extended National Health Insurance. Laxity in certification has been an accusation persistently hurled at the panel doctor ever since National Health Insurance began, and it is one which is the harder to rebut because of the small but hard core of truth inherent in it. The doctor's financial interest in satisfying his patients and his inevitable sentimental tendency to give them the benefit of any doubt cannot fail to land him, however careful, in a certain degree of unfairness at times.

If the general practitioner were relieved of the duty of certification he would be freed from one of his most baffling difficulties, and at the same time the most obvious Governmental reason for "Nazifying" him would be removed. It seems that this might be done by transferring this function to medical boards of two doctors, which would take over the duty

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY AUGUST 28 1943

Correspondence

The Council's Recommendations

SIR,—I hope that the profession will amine carefully the somewhat reactionary proposals in the Supplementary Annual Report of the Council of the M.A., published in the *Supplement* of Aug. 7. The Council seem to regard chiefly those democratic principles for which most of us, when asked, would say at we were fighting. Parliament, the elected representatives of the people ever mind how long ago), and the cabinet have indicated their adoption of assumption B of the Beveridge report—i.e., a comprehensive medical service for the nation. The proposals of the Council indicate a preference for a continuation of the old system with certain grudging additions, but retaining the social distinctions between panel and private patient with all its implications and drawbacks. Surely my memory is not at fault in believing that last year's Annual Representative Meeting passed by a majority, however small, a resolution that the service should be available to the whole population? The Council have acknowledged the validity of the A.R.M. resolution against a salaried service. Is it not unprincipled to ignore the other resolution, which cuts into the question of buying and selling practices, among other things? The report (Recommendation I) implies the right of every citizen to buy the services of any doctor privately, although that doctor is under contract to the national service. Is not this a most unprincipled principle? The ability to pay privately for an essential which should be readily available to all is the way that all "black markets" start.

The Council make great play with the "State" bogey. Quite unwarrantably Recommendations D to H imply that the state, by controlling a service, would damage the doctor-patient relationship. They flavour these courses with the old familiar garlic of free choice being in danger.) After playing with the notion that no economic barrier shall prevent anyone from getting the best treatment (Recommendations C and D), they proceed rather shakily through a gradual lessening of enthusiasm for this principle until they permit us to gaze (Recommendation M) with lack-lustre eyes upon the promised land—"Assumption B should be satisfied by an extension of National Health Insurance." Away we go, back into the good old days of the 1930's, with the familiar traffic block in Harley Street transferred to the vicinities of the hospital. (I am sorry, Sir, but would the R.S.O. start the first case? Mr. Midas is seeing Lady Newt.) Incidentally, can anyone tell what special advantage from the patient's point of view there is in paying a special fee for medical service and treatment if this advice and treatment are not better than could be obtained through the general service?

There is one last chance to show the Council how disquieted many of us are at this indigestible report. The Divisions will have the chance to discuss the proposals, and I hope that we shall send back to Tavistock Square a most emphatic "No" to the report. We have a good chance of aiding and guiding a progressive measure on to the statute book. We can insist that the administrative structure of the medical service shall be such that, while the community retain control of the service that goes with responsibility, the doctor has free control of the treatment of his individual patient, and equally with the patient retains the right to change when he finds himself out of sympathy. No one from the Government so far has suggested that these principles are incompatible with a national medical service.

I suggest, Sir, the Council having adopted the somewhat unusual course of replying to the White Paper before the publication of that document, that we await the Government's proposals in a spirit of willingness to play rather than preconceived obstruction. Personally, I shall feel rather uncomfortable if we have to appear on the same platform as the "grunting bears" and the "snorting bulls" of big business and vested interests in the breath of whose nostrils is detectable almost that same quality of halitosis which is called Fascism.—I am, etc.,

R. P. W. SHACKLETON.
Park Prewett Hospital.

Proceedings of Council

SIR,—The report of the Council's proceedings (*Supplement*, Aug. 7, p. 20) referring to the recommendations to Divisions states: "The report as amended was then unanimously agreed to." We desire to point out that this is incorrect, as the signatories of this letter abstained from voting. We did not vote against the report as a whole because, though we had opposed some of the recommendations, there were others with which we agreed.—We are, etc.,

P. INWALD.
WILLIAM W. FOX.
London, N.19.

An R.M.O. on State Medicine

SIR,—I am delighted to see that a more practical view is being taken of a State Medical Service, and that more sympathy is being shown to the doctors absent in the Services. These absent doctors can give from practical experience advice which could be obtained by no other means. Of all the G.P.s in the R.A.M.C. whom I have met only one wishes to remain in the Army, in spite of having tested the delights of office hours, no night work, regular leave, and a fixed salary.

For myself I chose my university and medical school, I chose the hospital I went to after qualifying, I chose the part of the country I wanted to practise in, and I chose my partner. As soon as the war started I chose to go into the Army. My choosing days are now over until I

return to civil life, with one exception. I can continue to remain an R.M.O. if I continue to refuse promotion—a choice which cost me a considerable amount of pay. To tell me that archbishops, research workers, and doctors in municipal hospitals work for a salary is of no interest to me; after all, they chose that type of work.

The Army provides a magnificent service of preventive medicine, a state of affairs which must be copied after the war. Personally, I favour health centres with either an extension of the panel system or some form of capitation fee. The patient is the person to decide who is the good doctor, and such preferences should bring an increase in pay. I can see no reason why such increases should be dependent on the good will of some routine-bound official.

One only seems to appreciate freedom when one has lost it; let us not learn this lesson by bitter experience when there is such a large body of people who are actually in a position to see both sides of the question. Could not a special questionnaire be sent to all doctors serving with the Forces, as I feel it would greatly help any discussions now being held in Britain?—I am, etc.,

B.N.A.F. "R. M. O."

Diploma in Physical Medicine

SIR,—The *Supplement* of July 10 (p. 8) contains a list of the subjects forming the syllabus of the Diploma in Physical Medicine. The two parts are admirable in themselves, but I am greatly concerned to discover that no question appears to arise of requiring knowledge on how a diagnosis may be arrived at in cases needing physical treatment. Surely it is essential that there should be three parts: Part I: as stated; Part II: diagnosis with a view to physiotherapy; Part III: physical treatment.

I know that it is late in the day to make this suggestion, but it appears to me vital to the whole concept of treatment that a diagnosis is reached first.—I am, etc.,

London, W.1. J. H. CYRIAX.

A revised memorandum on the conditions under which women students may begin and complete courses of study states that any woman who has, on or before her 19th birthday, been accepted for admission as a student of medicine, dentistry, veterinary surgery, or pharmacy may take a full course, provided satisfactory reports of progress are made by the school at which she is studying. As regards other students, a woman who is 18 on or after Oct. 1 next may be admitted to a three-years course and a woman who is 19 on or after that date may be admitted to a two-years course if they can complete the work necessary for a degree or diploma, etc., within that period. These students may then take an approved course of professional training not exceeding one year in the following subjects among others: chiropody, massage, nursery nursing, occupational therapy, orthoptics, public health, radiography, dietetics, hospital almonry, and mental health.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 4 1943

EVOLUTION, NOT REVOLUTION*

BY

G. C. ANDERSON, C.B.E., M.D., LL.D., F.R.C.P.

Secretary of the British Medical Association

It is the intention of the Minister of Health and the Secretary of State for Scotland to issue very soon a White Paper containing the Government's ideas of a comprehensive medical service advocated by Sir William Beveridge as a necessary assumption in a social security scheme. What will be in that White Paper I don't know any more than you, but it is to be hoped that it will not attempt to do more than pose the issues involved, and that it will be left to Parliament, the public, and the profession to give them exhaustive consideration before the Government makes up its mind as to how to form legislation will take.

A committee representative of the profession has been engaged in non-committal consultation with the Minister of Health and his officials, and has placed before them what it believes to be the views of the majority of the profession. No negotiation has taken place, but views have been exchanged; and we must now await the White Paper to see how far the Ministry has been influenced. The Minister, however, has promised that the White Paper will indicate the Government's view only, and will in no way commit the Representative Committee or any other body which has been engaged in consultations with his Department.

Should the White Paper appear before the Annual Representative Meeting on September 21 we shall not discuss it at that meeting. Divisions will not have had time to instruct their Representatives on it, and it will be much too important to be dealt with hastily. After the A.R.M., at which a number of general principles relating to the future of the medical services will have been discussed and formulated, the considered views of the various sections of the profession will be ascertained. The White Paper will be examined by Divisions and Study Groups, and by the Standing and Group Committees of the Association; and the Medical Planning Commission will study it. The views of doctors on Service will be collected, especially of those over-seas. Finally, the Council, after considering all these views, will formulate proposals and submit them to the Divisions of the Association, to whose meetings non-members will be invited. Then a Special Representative Meeting will be held in the early

part of next year. In this way the considered policy of the Association will be made available to any committee representative of the profession formed to carry on negotiations with the Ministry of Health.

In the meantime Parliament will have been discussing the White Paper, and, after consideration also of public and professional discussion, the Government will doubtless introduce legislation to make the necessary provision for a comprehensive medical service. I expect the Bill will be in very general terms to confer the necessary powers, and when it is passed regulations will be prepared to give effect to the Act. When these regulations are being formulated the profession will need all its resources in negotiating with the Government on the terms and conditions of service for practitioners taking part in the scheme.

As I see it, therefore, our work falls into four distinct phases: first, the preliminary discussions, which we have just finished; second, the study of the White Paper; third, discussion and negotiation before legislation; and, lastly, negotiation on terms of service, upon which, of course, will depend the final attitude to be adopted by the profession as an organized whole.

The Attitude of the Profession

Now that we have reached the end of the first phase, let us take stock of the position and attempt to determine our attitude as a profession towards the proposal to implement Assumption B of the Beveridge report. Are we going to say that we are content with the medical services as they are at present, and that we are not prepared to consider any change? Or are we going to the other extreme and demand a complete uprooting of professional traditions in favour of, say, a full-time State salaried service for all practitioners? Or are we going to give the Government's ideas, whatever they may be, a considered hearing and see how far we are prepared to agree with them?

In my position I can usually gauge the feeling of the profession on any question that stirs it deeply, and, after talking to men and women in different branches of practice, and hearing and reading speeches, and seeing the correspondence in my own post-bag and in the medical press, I see a danger that the profession

may allow itself to be swayed by a wave of emotionalism that may prevent it from giving the very serious problems that confront us a reasoned and unimpassioned consideration.

When the Draft Interim Report of the Medical Planning Commission was issued last summer there seemed to be general agreement that development on some such lines as the Commission indicated was desirable and, indeed, necessary, and the Commission was requested by the Annual Representative Meeting to give detailed consideration to its suggestions for health centres, central administration by a corporate body, regional authorities, central and local advisory committees, and so on. Before the Commission had got very far there came the Beveridge report, with its proposal for a comprehensive medical service available to the whole population.

Though at first there was a certain amount of enthusiasm for such a service as part of a nation-wide social security scheme, and though the profession expressed its willingness to enter into consultation, through the Representative Committee, with the Government on the problems involved, I have seen a tendency during the past few weeks for opinion in the profession to swing right back from the progressive outlook of the Medical Planning Commission to an ultra-conservative outlook varying between a "no-change" attitude and an advocacy of an extension of the scope of the National Health Insurance system to include dependants of the present insured persons and to provide consultant and specialist and laboratory services. I think this reaction is due, at least in part, to the premature disclosure, before the interchange of views between the Representative Committee and the Minister and his officials had been completed, of the Minister's suggestions on the method of employment and remuneration of doctors, and the part local authorities might play in the administration of the scheme. This is a pity.

The Representative Committee has throughout the discussions impressed upon the Minister the expressed opposition of the majority of the profession to a whole-time salaried service, and the views of the profession on local medical administration as gathered from the observations made on the Draft Interim Report of the Medical Planning Com-

* Text of an address given to meetings of the profession in Manchester, Edinburgh, and Glasgow.

[illegible]

le to benefit will be in the highest-income group, say the upper 10%, and a large proportion of this income group will not wish to obtain treatment under a scheme. I can foresee that such persons will not announce their decision till one of the family is ill, and then a doctor, if he is working in the official scheme, will be embarrassed by the patient's insistence on paying for treatment. It would seem desirable that the official scheme should include as compulsory contributors those who may reasonably be expected to need assistance, say about 90% of the population, and that the small upper income group could have an option to come in as voluntary contributors. This would be more practicable and more convenient to medical practitioners than that the upper income group should opt out of an official scheme. This, of course, implies an income limit to which there will be subtle opposition. Nevertheless, it is our duty to put forward our view to the Government, and Parliament will decide between the two.

What is to be our attitude if Parliament decides that the official scheme must include everybody? Are we going to oppose it, or are we going to accept the decision as an expression of the will of the people and direct our efforts to securing good terms of service for medical practitioners so that they may be in position to make the service as efficient as possible? We must be clear about this, for it may be one of the first problems to be faced in the next phase; our attitude towards it will set the pace for the procedure.

Although we may prefer a 90% scheme, if Parliament decides upon a 10% scheme we should accept it. Parliament is the mouthpiece of the people, and each section of the community should usually accept its decision. If we try to fight it we are likely to lose the sympathy and good will of the public, and our subsequent moves will be regarded with suspicion and branded as self-interested. We shall in the end gain more by reserving our strength for negotiating the terms and conditions of service. It will be then that we can demand machinery to enable patients to obtain private treatment if they so desire, to determine in what circumstances a doctor may charge a fee, and to prevent abuse by both doctors and patients. This will be the time to act, to not prejudice the ultimate success of our efforts by premature judgment or precipitate action.

Control or Direction?

There is a word that is now being made use of in some quarters to inspire the profession fear of any kind of reorganization. It is the word "control." Control does not mean, or should not mean, official control of clinical treatment. We should resist to the utmost, as we resisted in 1911, any attempt to introduce a third party between the doctor and his patient. We should resist any detailed control of a doctor's pro-

fessional work or of his relations with his colleagues. Nor should we agree to any scheme in which the doctor is made responsible in any professional sense to a lay authority.

But in any efficient service so complex as a comprehensive medical service there must be "control" in the sense of "direction." In any properly co-ordinated comprehensive medical service the individual general practitioner will have numerous relationships. Not only will he see his patients at their homes or at his surgery or health centre, but he will take part in public health work; he will be associated with a hospital, perhaps by treating his own general practitioner cases there, or by acting as a clinical assistant in a department; he will have better opportunities for consultation with consultants and specialists and will have readier access to auxiliary services; he will co-operate with industrial medical officers; and he will, it is hoped, attend post-graduate courses regularly.

Collectively, both centrally and locally, the profession must maintain close contact with many aspects of social life, such as industry, education, youth organizations, hospital administration, the auxiliary services, and public administration. Continuous working co-operation on such a large scale can be maintained only if there is general direction and co-ordination of the various parts; and the individual practitioner, as an essential unit in the scheme, must accept this general direction. If we accept the idea of a comprehensive medical service we must accept a measure of co-ordinating direction by suitably constituted authorities.

The fact that public money will be required for the development of the health services is another reason why we must acquiesce in a certain amount of control in the sense of direction. Voluntary effort cannot do all that is required. The voluntary hospitals will not be able to maintain themselves after the war without financial assistance from the Government. Adequate specialist services cannot be made available for everyone without assistance from public funds. Payment of hospital medical staffs, which is now advocated on all sides, will make possible a more equal distribution of competent consultants and specialists throughout the country. An adequate and efficient service can be provided only by a well-directed scheme with enough funds to attract a sufficient number of specialists in all the different branches, and only with the assistance of public funds can such a service be assured.

Again and again one hears in every branch of practice that doctors could give a better service to their individual patients and devote more attention to the preventive aspect of their work if only they had more time. More time means more money, and more money means more help from public funds. Further, much of the equipment required for specialist treatment tends to become more elaborate and expensive and cannot be provided in sufficient quantity by private

or voluntary enterprise. It seems to me useless to say that we want a better and more extended medical service and in the same breath to declare that we will have nothing whatever to do with public direction. We must of necessity, if we are true to our ideals, accept financial assistance from the Government; and if we accept it we must make ourselves responsible to the Government for its proper expenditure.

I do not want you to think from all this that I am advocating a whole-time State Medical Service. Far from it. I think that what is usually proposed under the title of a whole-time State Medical Service is a wrong conception of medical practice. It is too rigid and regimented, and would frustrate individual initiative and enterprise. But, though we may refuse to become the whole-time servants of a Government Department, that is no reason why we should go to the other extreme and reject all idea of co-operation with the State—that is, the community in its corporate aspect.

Principles of an Efficient Service

A properly co-ordinated comprehensive medical service must be based on sound principles or it will only create more difficulties than it solves. It is with this object in view that the Council of the Association has submitted to the Divisions, for approval by the Representative Body, proposals in the form of recommendations, which in its judgment should govern any future medical service. I will deal with only a few important issues which arise out of them.

The degree of the efficiency of any national medical service, as regards preventive and curative medicine, must depend upon the available medical and scientific knowledge and the use made of that knowledge, upon the character and extent of medical education, and upon the quality of the individual members of the medical profession. I think everyone will agree that our medical services do not yet reach the highest attainable degree of efficiency. We must set before us certain general aims. For instance; we must aim at securing the best possible type of entrant to the medical schools. Medical education, both undergraduate and postgraduate, must be maintained on a high standard and be constantly adapted to meet modern needs; facilities for postgraduate medical education must be much greater than they are at present; facilities and resources for medical research must be greatly increased and methods devised for their adequate application. We must also give some consideration to the human material from which future doctors are made, and give the opportunity to enter the profession to any boy or girl from whatever section of the community who shows a natural inclination for medicine and who has the requisite character, health, and intelligence. We must also aim at the removal of any economic barriers that may prevent an individual taking advantage of the medical services provided.

We should have a clear conception of the kind of administrative structure we want. Unless the foundations are sound the success of the whole of the medical service will be jeopardized. We must secure that the comprehensive medical service shall not be prejudiced by over-hasty or ill-conceived administrative reforms, and consequently we must insist that, until the administrative foundation is securely laid, no other changes will be initiated.

If a comprehensive medical service is to be provided by the Government there must obviously be a central administrative authority. The central authority, whether it be a Government Department or a corporate body, should be responsible for all the civilian health services and only for those services. So long as different Government Departments retain their civil health functions we shall never achieve that unification which is essential to a properly co-ordinated comprehensive medical service. And it is equally evident that the central authority responsible for such a service should not be saddled with other functions.

Next we must insist upon the principle of vocational advice being observed. The failure of the Government to consult the profession on matters of medical policy has been responsible for many of the difficulties with which we are faced to-day. No endeavour has been made to work out a national health policy in consultation with the profession; we have had to put up with piecemeal reforms to get over particular or temporary difficulties. The efforts of the profession to improve the health services have in this way been frustrated. We should insist that in both the central and local administration of the comprehensive medical service there must be statutory advisory medical committees, which must be consulted on all matters of major health policy.

The profession has expressed a preference for a new central body to take the place of the present Ministry of Health, the new body being corporate in character, autonomous on matters of detail, and responsible on major policy to Parliament through a Minister. I should like to see the central administration in the hands of a corporate body, although I recognize that there is a question of public policy involved in the proposal, and that Parliament alone can decide the issue. If we prefer the corporate body we should try to persuade Parliament to our view. But so long as we are assured of adequate advisory machinery perhaps it may not matter a great deal whether the authority is a corporate body or a Government Department.

Now we come to the more difficult problem of local administration. One thing we are all agreed on is that we shall not accept a medical service which is administered by local authorities in their present form. They are unsuitable in size, composition, procedure, and experience. New administrative health

Free Choice and Remuneration

As there is a relationship between free choice and the method of remuneration of the doctor's service I shall deal with both together. Free choice of doctor should be preserved as a basic principle, and no restriction of our medical services should prevent or discourage this. The health and welfare of his patient are the doctor's first interest, and nothing must be done to upset the intimacy of the doctor-patient relationship. Is there any danger of this if the doctor—and here I refer to the general practitioner or family doctor—is employed on a whole-time basis and paid by salary? I think there is. Those who advocate this method usually seem to envisage the general practitioner working as a whole-time medical officer of an authority in a clinic or health centre at which he would attend at regular times, and they usually add that free choice of doctor would be allowed from among the doctors working at the centre.

There appear to be certain difficulties about accepting this view. How can free choice of doctor exist in any real sense in a system where doctors are employed as whole-time officers with regular hours, although this is one of the main privileges put forward by many advocates in favour of a whole-time salaried service? A doctor who receives a patient on his list must accept full responsibility for him and be available to him for service at all reasonable times. A patient will not time his illness to coincide with the doctor's hours of duty. How can special merit be rewarded or special study encouraged through a salary scale in which increments are given on the basis of age and length of service? I can think of no satisfactory solution.

Again, who is to decide whether a doctor is giving full service for the salary he receives or is worthy of receiving an

increment within the scale? The more number of attendances and visits during a period or the time spent in professional duties are no criteria of the thoroughness of a doctor's work, and an external medical officer of the administrative authority is not competent to judge by inspection. The patient is the only person who can directly assess, however imperfectly, the service his doctor is rendering to him, and to the number of persons or families who elect to go on his list. That, of course, means a capitation fee. If the White Paper should make any proposal for whole-time salaries I hope that you will consider it from this practical point of view, and not sweep it aside with the passing comment that no man who receives a salary does good work, or that the mere acceptance of a whole-time salary would make a doctor a civil servant. Having had no experience of salaries in general practice, except for assistants, we ought not to be afraid to experiment in that method in experimental health centres, but at the moment payment on a capitation basis would appear to be the only satisfactory system for general application.

Private Practice

And now as to the vexed question of private practice within an official scheme. I have already discussed this matter as it arises in the 100% v. 90% issue, but it appears also in another guise. Is a patient compulsorily insured to be allowed to obtain private treatment if he so desires, and is a doctor who joins the official service to be allowed to give private service? In other words, is a patient to be allowed not only free choice of doctor but also free choice of the type of service? He should have such freedom, but he should not, of course, be allowed to pay fees to the doctor on whose list his name appears, although he should be able to obtain medical advice and treatment, whether regularly or on particular occasions, from another doctor and to pay private fees for the service.

If this be conceded, the next question is whether a doctor in the service should be allowed to give such private treatment. I think the answer is "Yes." Refusal of such permission would be likely to split the profession into two groups—the official and the non-official doctors. We have therefore proposed as a basic principle that private practice within the official service must be available, but no ground must be given for any assertion that private attention is better than that rendered under the official service. There must, of course, be regulations to prevent abuse, and although I realize the difficulties, the framing of suitable regulations should not be impossible, given good will on all sides.

At present consultants and specialists are badly distributed. Many areas are practically or entirely without facilities for consultant and specialist services, and the receiver of service for the salary a doctor is giving full service for the salary he receives or is worthy of receiving an

patients cannot always travel long distances to the nearest centre. This is in the main an economic difficulty, for consultants must depend to-day on private practice, and sparsely populated or poor areas just cannot provide a living for consultants and specialists in the different branches. The Draft Interim Report of the Medical Planning Commission dealt at some length with the means of overcoming the problem, and I would ask you to reread the section, for, though the report envisaged a scheme covering only 90% of the population, it seems to offer a practical plan to ensure that every member of the community shall be able to obtain the service he needs.

Consultants and specialists in the comprehensive medical service would be based on hospitals—that is, they would hold hospital appointments or be associated with particular hospitals. The consultant's services would be given either at the hospital or at the patient's home. Every area would be assured of access to consultant or specialist services, and groups of small hospitals might share the services of consultants in the different branches of medicine. The subject is still being explored by the Representative Committee, but I think we have gone far enough to lay down a principle that consultants and specialists should be based on the hospital. The question of criteria for determining consultant status has to be considered. I have no doubt that the Representative Committee will discuss it, and it is already being considered by the Royal Colleges.

The Medical Planning Commission was generally in favour of paying consultants and specialists by salary—but we were then envisaging a service for 90% of the population. Should the service embrace 100%, further consideration will have to be given to this subject. Payment by salary is undoubtedly the most appropriate for hospital work, but for work outside the hospital, in the homes of the people or in health centres, when constituted, other methods may be preferable. In the further thought which must be given to this problem we may be assisted by the forthcoming report of the Goodenough Committee, although it will deal primarily with hospitals attached to medical schools.

There appears to be a tendency to concentrate on the reorganization of general practice and to leave the reorganization of consultant practice for later consideration. This seems to me quite wrong. All branches of medical practice must be conceived as a single service. A general practitioner cannot do his work properly if an adequate and efficient consultant and specialist service and adequate hospital accommodation and ancillary services are not readily available to him. The efficiency of the whole service is dependent on the efficiency of each of its parts and the efficiency of the co-ordination between them. It would be detrimental to the complete service and to the individual practitioner to put one part of the service into operation before the others were ready.

In his report Sir William Beveridge suggested that, though hospital services would be included in the insurance scheme, the patient might be asked to pay what he called "hotel" expenses, and it is possible the Government might favour this plan. If this were so, a patient well able to afford extra "hotel" charges for the extra comforts and amenities of a private bed would be prepared to pay for these, while at the same time he would expect to receive medical and surgical treatment through the official service. If the patient wants something more in the way of accommodation than the general wards provide then he should be regarded as taking himself outside the official service altogether, and he should be expected to pay not only for his extra comforts but also for his medical and surgical treatment. It should, therefore, be expressly laid down that for those persons who wish to be treated in private accommodation, whether part of a hospital or not, private consulting practice should continue.

Immediate Proposals

The country, I believe, expects that some steps will be taken soon to implement Assumption B of the Beveridge report. There are two directions in which action can be taken without undue delay, and by action I mean the preparation of a plan, as obviously the plan cannot be put into operation till the war is over. The proposals contemplated can be taken within the framework of the present administrative structure; they will go a long way towards implementing Assumption B, and they will provide valuable experience on which to base our views of the final form of a comprehensive health service.

The first step that can be taken is the two-way extension of the National Health Insurance system, which has been advocated by the B.M.A. for many years. If the National Health Insurance system could be extended to include dependants of insured persons and others of similar economic status and to cover consultant and specialist services and laboratory and hospital facilities as well as general practitioner service, it would go a very long way towards giving the great majority of the population as complete a medical service as possible in present circumstances. For the service to be completely satisfactory we should need more doctors, with an equable distribution throughout the country, both general practitioners and consultants, more equipment, more institutional accommodation, and more co-ordination. But if the country wants Assumption B immediately the extension of National Health Insurance is a useful step to that end.

Experiments in Group Practice

The second step is to experiment in group practice. There has been much talk about health centres, and schemes have been put forward, basing the whole of the domiciliary medical service on them. But we are not yet all agreed what a health centre is or how it would

work. The Medical Planning Commission suggested a possible model scheme, but it has not yet received the full approval of the profession. In view of this, it would be contrary to the public interest and unfair to the profession to uproot the traditions of medical practice unless we were quite sure that we had something better to put in their place. I am not opposed to the health centre idea: far from it. For it seems to me that practice conducted upon some such lines offers the best prospect for the doctor to associate himself more intimately with the preventive aspect of medicine. For example, the medical personnel of a health centre could, as a whole, assume responsibility for ante-natal, natal, and post-natal work, infant welfare, and school medical work, at present rendered by the medical staff of the local authority—work which rightfully belongs to the sphere of general practice. But the only way to satisfy ourselves that health centres or group practice are better than individual practice is to try them out experimentally.

Meantime, local government structure could be re-examined, thus affording time and opportunity for experimenting with the health centres. The experiments must be conducted in suitable areas and on a controlled scientific basis, and we should expect the Divisions of the B.M.A. to give valuable assistance. We must try to find out from the experiments what a health centre should be. Should, it be a communal surgery, where several doctors have their surgeries and share the expenses and staff and equipment? I believe many doctors would find such group practice a blessing, especially after the staff difficulties they have experienced during the war. Or, on the other hand, should the health centre be a diagnostic centre, where the general practitioner can obtain diagnostic facilities on the spot? Such a centre would probably be found most useful in a semi-rural area where there was no hospital within easy distance. Or, again, should there be beds in a health centre? We should make some of our experimental health centres in the form of cottage or home hospitals, where general practitioners could treat their own general practice cases—a proposal which has much to commend it. And, finally, what form or type of health centre would be suitable for a rural area?

These experiments, especially those in group practice, will also give us an opportunity of testing the different methods of remuneration. It might perhaps be arranged to pay to a health centre a single sum to cover the whole of the expenses, including the remuneration of the medical staff. The sum might be the aggregate amount of the capitation fees due to the co-operating practitioners, but the amount available for distribution among the medical staff might, by agreement among themselves, be paid by capitation fee or by salaries, or by a combination of both. When we have spent a reasonable period on this experimental work, perhaps two or three years and not before, we should be in a position to

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 11 1943

THE DERBYSHIRE PANEL BENEVOLENT AND EDUCATIONAL TRUST

BY

H. W. POOLER, M.B., B.Ch.

Hon. Treasurer to Panel Committee and
Chairman of the Trust

When, in 1932, the Derbyshire Panel Committee completed the payment of its quota (£3,368) to the National Insurance Defence Trust, the question arose of the disposal of the anticipated surplus income. At that time, as now, about 50% of the voluntary levy of 1d. per insured person was absorbed by administration expenses and taxation. The other half had been disposed of by the payment of the annual quota to the National Insurance Defence Trust, an annual subscription for many years of £100 to the B.M.A. Charities Trust Fund, and a donation at Christmas in response to Sir Thomas Barlow's special appeal for the Royal Medical Benevolent Fund. Suggestions had come from the Insurance Acts Committee that panel committees which had completed their quota might continue to subscribe to the National Insurance Defence Fund. As many areas had not completed their quota and some districts had subscribed little or nothing, that suggestion did not appeal to Derbyshire. Another suggestion was that the voluntary levy should be reduced to a halfpenny, but this would have created difficulties if ever it was desired for any reason to increase the levy again.

At this point it was suggested that the surplus income should be devoted to a benevolent and educational trust for the benefit of members of the Derbyshire Panel and their dependants. This at once appealed to the then members of the panel committee, and was subsequently approved at a special general meeting of panel practitioners. Accordingly, with the valuable legal assistance of Dr. O'Rourke, a deed was drawn up and a trust formally created. Stripped of its legal paraphrase this deed states that the objects of the trust are: (1) the payment of grants to any member of the Derbyshire Panel or his (or her) dependants who are in need of relief or assistance (up to £25 may be advanced by the chairman of the trust without previous reference to the committee of management in cases of great need); (2) subscriptions or donations to suitable charities; and (3) the establishment and maintenance of scholarships in medical schools, universities, and technical colleges, and also at approved schools for younger children. The trustees of the fund are the chairman, hon. secretary, and treasurer of the Panel Committee, and the committee of management includes the trustees and five other members of the Panel Committee elected by that committee.

Such is the trust, subsequently copied by Nottinghamshire, and probably other panel committees, and the following is a brief summary of the cases that it has helped:

1. A widow with several children: Two grants of £50 each to a daughter for technical training, and £50 to a son towards university education.

2. The son of a medical man in poor circumstances: Five sums of £50 and one of £35 to pay fees at a medical school; this boy qualified in due course.

3. The daughter of a deceased member: £60 towards technical training.

4. The son of a member: A loan of £300 (since repaid) free of interest to pay his premium at an engineering works.

5. The widow of a member who died at an early age received £50 for technical training.

6. A widow and six children of a member killed in a motor accident: The son, £50 for Glasgow University Medical School; two daughters, £50 and £20 for training in domestic science.

7. Son of a medical man in poor circumstances: £15 15s. towards fees at Edinburgh University.

8. Widow and child of a deceased member: A grant of £50, with a review of the position when necessary; an application to the Royal Medical Benevolent Fund secured 30s. a week for the widow for three months.

9. Widow and children of a deceased member: Educational grants of £150, £120, and £35, and a successful application for a Foundation Scholarship at Ensom College for the boy.

10. Widow and two children left penniless by a deceased member: £20 at once to meet urgent necessities; maintenance for the daughter for about three months while completing her secondary education; £25 to the widow for removal and other expenses, and £75 at the rate of £2 weekly, with review of the position at the end of six months; a recommendation to the Royal Medical Benevolent Fund resulted in a grant of £2 a week.

In addition the Panel Committee has continued its annual subscription of £100 to the B.M.A. Charities Trust Fund and its grant of £10 10s. to the Royal Medical Benevolent Special Christmas Fund; it has also given £450 to the Medical War Relief Fund in the last two years, besides paying income tax and administrative expenses. The trust has also accumulated and has invested over £2,579. Out of the interest from such investments and balance in the bank it is able to make grants and meet its very small administrative expenses. It may fairly be claimed that the trust has well justified its formation and continued existence.

CERTIFICATION FOR EXEMPTION FROM FIRE GUARD DUTIES

The following statement has been issued by the Ministry of Labour:

Under the Fire Guard Regulations, 1943, on and after September 20, 1943, an applicant for exemption from fire guard duties on medical grounds is required to furnish with his application a medical certificate relating to his medical condition. Normally fire guard duties fall into two categories:

(1) *Duties as a member of a stirrup pump team.* The physical requirements for a member of a stirrup pump team are regarded as fair sight (with glasses if worn) and hearing, ability to work a stirrup pump, to carry a bucket of water for 25 yards on level ground, and to climb two flights of stairs at a reasonable pace without distress.

(2) *The lighter duties:* (a) keeping watch for incendiary bombs and outbreaks of fire; (b) summoning assistance (otherwise than by acting as a messenger); (c) maintaining fire guard equipment and supplies of water in serviceable condition.

It will be very helpful to the Government Departments concerned if a practitioner

when issuing a certificate corroborating a person's claim of unfitness for fire guard duties will state his opinion about the person's fitness, not only for duties as a member of a stirrup pump team but also for the lighter duties mentioned above.

At the end of the new prescribed form of application for exemption (which is obtainable from local offices of the Ministry of Labour), a medical certificate is printed specially set out to enable a practitioner to express his opinion on a person's fitness for each of the two categories of duties, and it is hoped that doctors, when consulted by an applicant for exemption, will use this form. Occasionally an applicant for exemption may have been directed to undertake some special duties which do not fall into either of these two categories—e.g., operating a power-driven pump. Where this is the case the applicant is required to give sufficient particulars in his claim to show the amount of exertion required for the special duties which he or she has been directed to undertake. In the medical certificate form printed on the form of application there is a space in which the practitioner can express his opinion on a person's fitness for such special duties.

Correspondence

Then and Now

SIR,—These are a few extracts culled from the columns of your *Journal* and the *Lancet* of 1911, and are very reminiscent of many letters, inspired and otherwise, which are to-day appearing in the medical and lay press:

"The result must be inevitably absolute ruin to a great number, probably the majority, of general practitioners throughout the country."

"The scheme may perhaps end in reducing doctors to so many machines for attending democracy at so much a head."

"We stand at the parting of the ways— independence and self-respect on the one hand, and servitude on the other."

"It is a long step on the downward path towards Socialism. It will tend to destroy individual effort and increase the spirit of dependency which is ever found in degenerate races."

They reflect the feelings of anxiety and apprehension with which the majority of doctors in those days regarded the introduction of the National Health Insurance Act. How ill founded these fears proved to be is now testified by the Council of the B.M.A., which is to-day prepared to extend the National Health Insurance Act to embrace practically the whole population.

Although mindful of the great benefit to the community which the National Health Insurance Act has brought about, those who are acquainted with the present incoordinated state of our health services realize that such an extension is but tampering with the problem, and cannot provide an adequate basis for the organization of a comprehensive health

British Medical Association

ANNUAL REPRESENTATIVE MEETING, 1943

RESOLUTIONS BY DIVISIONS AND BRANCHES

The B.M.A. will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Tuesday, Wednesday, and Thursday, Sept. 21, 22, and 23, 1943.

Motion by OXFORD and WEST SUSSEX: That Recommendations A and B be transposed, Recommendation B being placed first in order under the heading "Principles" and Recommendation A second.

Recommendation C:

That the efficiency of a country's medical services, both preventive and curative, depends upon the availability of medical and scientific knowledge, upon the character and extent of medical education, and upon the absence of any economic barriers that impede the utilization of such resources for medical research should be greatly increased and methods devised to their adequate application; medical education, both undergraduate and postgraduate, should be maintained on a high standard and be adapted to modern needs; the facilities for postgraduate medical education should be greatly increased; and wherever economic barriers prevent an individual taking advantage of medical services such barriers should be removed.

Amendment by WINCHESTER: That after the words "of medical education" in the first sentence, there be inserted the word "quality of the personnel," and the word "and wherever economic barriers, etc.," at the end of the sentence be deleted.

Amendment by HARKOW: (1) that after the phrase "upon the character and extent of medical education" there be added the phrase "upon the existence of an adequate number of doctors"; and (2) that after the phrase "the facilities and resources for medical research" there be added the word "and medical education."

Amendment by PRESTON: That the word "barriers" and "should be removed" be inserted between the word "barriers" and "should be removed" in the last sentence.

Recommendation D: That, subject to these general and overriding considerations the functions of the State should be to co-ordinate existing provision, both official and non-official, to augment it where necessary and to secure that it is available without economic barrier to all who need it. The State should confine itself within these wide limits, involving the personal freedom of both citizen and doctor only to the extent which the satisfaction of these functions demands.

Amendment by GATESHEAD: That the words "strictly to these functions" be substituted for "within these wide limits" in the last sentence.

Amendment by BRIGHTON: That the words "involving the personal freedom of the State" be deleted.

Recommendation E: That the State, while assuming responsibility for the organization and provision of medical services, should not assume control of doctors rendering individual or personal health service. It should convert the medical profession into a salaried branch of central or local government service.

Amendment by ALDERSHOT and BASING STOKES: That the first sentence be deleted.

Recommendation A: That the Representative Body reaffirms the following basic principles laid down in the Association's *General Medical Service for the Nation* approved in 1938:

(1) That the system of medical service should be directed to the achievement of positive health and the prevention of disease no less than to the relief of sickness.

(2) That there should be provided for every individual the services of a general practitioner or a family doctor of his own choice.

(3) That consultants and specialists, laboratory services, and all necessary auxiliary services, together with institutional provision when required, should be available for the individual patient, normally through the agency of the local Service, as many do, that it need interfere with a free choice of doctor or with the doctor's freedom of professional judgment and treatment.

(4) That the several parts of the complete medical service should be closely co-ordinated and developed by the application of a planned national health policy.

Amendment by GATESHEAD: That the word "positive" be omitted from para. (1).

Amendment by WEST SUSSEX: That para. (ii) read:

"That the services of a general practitioner or family doctor of his own choosing should be available for every individual."

Amendment by BIRMINGHAM CENTRAL and WINCHESTER: That the word "available" be substituted for "provided" in para. (iii), so conforming with the wording of para. (iii).

Amendment by REIGATE: That all words after "developed" be deleted from para. (iv).

Amendment by WINCHESTER: That the word "existing" be substituted for "com- plete" in para. (iv), and that all words after "developed" be deleted.

Amendment by NEWCASTLE-UPON-TYNE: That the words "acceptable to the profession as a whole" be added at the end of para. (iv).

Motion by EXETER: That the Representative Body views with grave apprehension the institution of a comprehensive health service available to the whole community, believing that the time is not yet ripe for such a service, which would be in the interests of neither the public nor of the medical profession.

Motion by WINCHESTER: That the Representative Body opposes any fundamental change in the medical profession during the absence of so many members in the Services.

Motion by WORCESTER: That the Representative Body is not in favour of a whole-salaried State Medical Service.

Recommendation B: That the health of the people depends primarily upon the social and environmental conditions under which they live and work, upon nutritional standards, upon educational facilities, and upon the facilities for exercise and leisure.

Amendment by OXFORD: That the recommendation be amended to read as follows:

service for the nation. It would but perpetuate all the evils of a competitive system, with its traffic in practices whereby the highest bidder, with perhaps no experience and a minimum qualification, can undertake the medical care of literally thousands of the population. We should guard against repeating the errors of the past. If the present Government has been persuaded to implement one assumption of the Beveridge report, let us give it every encouragement and support, resolved that, having conceded part of a greatly conceived piece of social reconstruction, it must be prevailed upon to yield the whole.

Let us not beg the issue with dark suspicions of a satumne plot to trick us into a servile compliance with certifica-

tion weighted against our patients, and to make us watch-dogs of the public purse. It is a grave reflection on the integrity and courage of the large majority of our profession who have changed that simply because they have changed the State they will suddenly depart from their high tradition and cease to consider the best interests of their patients. It is also a misrepresentation of a State Medical Service to suggest, as many do, that it need interfere with a free choice of doctor or with the doctor's freedom of professional judgment and treatment.

The doctor's freedom of thought and action is best and most fully used when applied for the greatest good of the community, and of that the community must be the best judge. As you, Sir, in the columns of your *Journal* have so aptly said, "The last word in the man-

agement of the service for the people and financed by them should rest with their chosen representatives."

The individual doctor is looked upon by his patients with affection and esteem. The medical profession as an organized body does not in equal measure share that affection and esteem. Public opinion as represented by leading articles in the national press is handed against the attitude at present taken up by our leaders to the proposed reorganization of health services. Let us not twice in a generation be found obstructing the way to social progress. The people have a long memory.—I am, etc.,

S. LIPETZ, Edinburgh.

Achieving Unity

Sir,—At the last Annual Representative Meeting of the B.M.A. it was decided by a large majority that the members of the Association were opposed to a whole-time State salaried service. Kensington Division feels that persistent agitation against the decision of the majority must inevitably impair the authority of our representatives when they meet the Minister of Health and is therefore undesirable.

At a general meeting of the Division the following resolutions were passed:

"(a) That, concerning the urgent problem now confronting the profession, the utmost unity must prevail.

"(b) That in order to promote unity we emphasize our confidence in the present Representative Committee in co-ordinating with the Minister of Health."

It was recommended that other Divisions support these resolutions.—I am,

A. H. PREDTOR, Chairman, Kensington Division, B.M.A.

and that the word "whole" be inserted before "medical profession" in the second sentence. The recommendation would then read: "It is not in the public interest that be State should convert the whole medical profession into a salaried branch of central or local government service."

Amendment by WINCHESTER: That the first sentence be deleted, as this would apply only in a State Medical Service.

Amendment by CLEVELAND: That the words "while assuming responsibility for the organization and provision of medical services" in the first sentence be deleted.

Amendment by NORTH BEDFORDSHIRE: That the words "within limits" be inserted before "for the organization and provision" in the first sentence.

Amendment by PLYMOUTH: That the word "direct" be inserted before "control" in the first sentence.

Amendment by OXFORD: That the recommendation be amended to read as follows:

"That the State, while assuming responsibility for the organization and provision of medical services, should limit its control of doctors rendering individual or personal health services to ensuring the maintenance of a reasonable professional standard and a maximum of personal and professional responsibility. It is not in the public interest that the State should convert the medical profession into a salaried branch of central or local government service."

Amendment by HARROW: That the recommendation be split into two to read:

"(1) That the State, while assuming responsibility for the organization and provision of medical services, should not assume control of doctors rendering individual or personal health service.

"(2) That it is not in the interests of patient or doctor that the State should convert the whole of the medical profession into a whole-time salaried medical service."

Amendment by DARLINGTON, SHROPSHIRE AND MID-WILLES, and WINCHESTER: That the Representative Body, having considered the Report of Council, is opposed to the setting up of any central authority, medical or lay, to control the profession. On the contrary, it recommends that the health of the nation can best be served by acknowledging the necessity for improvement of social and environmental conditions.

Amendment by BARNSTABLE: That the Representative Body is not in favour of increasing the control of medical services either by the State or any other body.

Amendment by REIGATE: That the Representative Body opposes the setting up of any central body either medical or lay to control the medical profession.

Amendment by READING: That the Representative Body opposes any kind of control of the profession whatever.

Amendment by MID-CHESHIRE: That should the State assume responsibility for the organization and provision of medical service (as Recommendation D), it should not assume control of doctors rendering individual or personal health service.

Recommendation F: That free choice of doctor should be preserved as a basic principle of future health services, and no administrative structure should be approved which does not both permit and encourage such free choice.

Amendment by KENSINGTON: That the recommendation be amended to read as follows:

"That no administrative structure should be approved which does not both permit and encourage free choice of doctor and allow the right of the doctor to refuse acceptance of a patient."

Amendment by WINCHESTER: That the recommendation be amended to read as follows:

"That free choice of doctors should be preserved as a basic principle of health services."

Amendment by GATESHEAD: That the words "as between doctor and patient" be substituted for the words "of doctor."

Amendment by TORQUAY: That the words "by patient and of patient by doctor (wherever possible)" be inserted after "of doctor."

Amendment by CHESTERFIELD: That the words "and of patient" be inserted after "of doctor."

Recommendation G: That it is not in the public interest that the State should invade the doctor-patient relationship. The loyalty and obligation of a doctor rendering personal health service to an individual patient should be to that patient and to none other.

Amendment by TORQUAY: That the recommendation be referred back to the Council for further consideration.

Amendment by GATESHEAD: That the word "further" be inserted before "invade" in the first sentence.

Amendment by DORSET: That the words "and to none other" be deleted.

Amendment by OXFORD: That the recommendation be amended to read as follows:

"That it is not in the public interest that the State should invade the doctor-patient relationship. The loyalty and obligation of a doctor rendering personal health service to an individual patient should be to that patient and to none other. This presupposes that, in so far as the doctor is employed, he should be employed by the patient, to whom his responsibility will lie."

Recommendation H: That free choice of doctor should be reinforced by a method of remuneration which relates remuneration to the amount of work done or the number of persons for whom responsibility is accepted.

Amendment by DERBY: That the recommendation be amended to read as follows:

"That the method of remuneration shall relate to the number of persons for whom responsibility is accepted. It must clearly be understood that such remuneration shall apply to all services rendered in the prevention, diagnosis, and treatment of injury and disease in the individual, but that no doctor in the service shall be debarred from accepting additional remuneration for services in relation to an individual or a group of individuals on the request of a third party."

Amendment by HENDON: That the recommendation be amended to read as follows:

"That the method of remuneration should be related to the amount of work done."

Amendment by HARROW: That the recommendation be amended to read as follows:

"That free choice of doctor should be associated with a method of remuneration based on the amount of work done or the number of persons for whom responsibility is accepted."

Amendment by NORTHAMPTONSHIRE: That the words "associated with" be substituted for the words "reinforced by."

Amendment by BIRMINGHAM CENTRAL: That the following words be added at the end of the recommendation: "subject to agreed limitation of responsibility."

Motion by TORQUAY: That remuneration for services rendered is more satisfactory than a capitation basis for payment.

OTHER MOTIONS

Certification

Motion by DARLINGTON: That the Representative Body is unanimously of the opinion that all certificates required by employers, civil defence authorities, or similar bodies, stating that an individual is or is not fit for work, should be paid for to the practitioner by the body demanding it.

Motion by SWINDON: That the demand for certificates is becoming a burden and it interferes unduly with the professional work of the practitioner. It is suggested that a certificate issued at the beginning and end of an illness of reasonable duration (say one month) should suffice for factories and friendly societies.

Motion by CLEVELAND: That in view of the present shortage of medical manpower, which is likely to get worse with the liberation of occupied territory, the Council is requested to take all possible steps to reduce the amount of non-medical work at present required of practitioners, in order that they can have the opportunity of doing medical work, as such, in a proper manner.

Motion by DARLINGTON: That the completion of Form M.P.A.O. 38 (Ministry of Pensions) should not be required from the medical attendant of the person claiming pension, but that the Ministry of Pensions should adopt an alternative scheme which does not involve the medical attendant.

Fees for Domiciliary Diphtheria Immunization

Recommendation of Council:

That Section (b) of the scale of fees for diphtheria immunization be amended to read as follows: "(b) the fees per injection of immunizing material should be (1) not less than 3s. 6d. where injections are given at the home of the patient, (2) not less than 2s. 6d. where injections are given at the doctor's surgery."

Amendment by WEST SUFFOLK: That "7s. 6d." be substituted for "3s. 6d." in the recommendation.

Amendment by KESTEVEN: That "6s." be substituted for "3s. 6d." in the recommendation.

Tuberculosis

Motion by DORSET: That the Council be requested to consider the effect of Memo. 266T (relating to the early diagnosis of and financial allowances to cases of pulmonary tuberculosis) recently issued by the Ministry of Health.

School Medical Service

Motion by MID-CHESHIRE: That the B.M.A. should impress on the Government the great importance of developing a correct stance and poise among school children as a basis for healthy adult life.

B.M.A. LIBRARY

B.M.A. LIBRARY

The following books were added to the Library during February and March, 1943:

G. H. Cooray, J. V. F. Jayasinghe, A. S. Rajasingham, B. E. Fernando, Lieut L. A. V. Gabriel.
A fairly good response had been received to an appeal to doctors in Government service to join the Branch, as it had been found that only about 30% of practitioners registered in Ceylon were members.

The report concludes with a reference to the difficulties of producing a journal! wartime.

Amer, A. I.: X-ray Atlas of Silicosis. Second edition, 1943.
Macleod, P., and Prescott, P.: Vitamins in Medicine, 1942.
Bradford, F. K., and Spurling, R. G.: Interventional Disc, 1941.
Britton, H. T. S.: Hydrogen Ions. 2 vols. Third edition, 1942.
Burnett, F. M., and Clark, E.: Inducenza, 1941.

Views and Policy of Council Candidates

Divisions and Policy of Association.

Divisions and Policy of Association

Motion by PLATOON: That the Representative Body is of opinion that at the present stage of the planning of medicine and the special services of the State the Divisions should be more closely and directly associated with the policy of the Association, and requests that their democratically elected representatives should be called to a Meeting more frequently in Polandville.

Expenses of Representatives at A.R.M.

than at present, and not less than four times annually at quarterly intervals in order that they may be able, without undue delay, to interpret directly to the Council the feeling and opinion of the Divisions; that consideration should be given at an early stage to the reorganization and election of Council on a more direct and better geographical basis.

Hospital Staff Committees

Amendment by BIRMINGHAM CENTRAL: that in the paragraph of the Annual Report of Council relating to Hospital Staff Committee the first sentence be amended to read as follows:

Demobilization

Demobilization
Motion by Mtd.-Cheshire; That the Association by Mtd.-Cheshire appoint a committee to review the problem of demobilization and absorption into practice of demobilized or displaced doctors, and prepare plans to minimize hardship to doctors and patients alike.

Standing Orders

Motion by EASTBOURNE: That the Standing Orders of the Representative Body be amended by the insertion of the following new paragraph in S.O. 21:

to be Held
PERTH BRANCH.—At Perth Royal Infirmary, Fri
Sept. 17, 8.30 p.m. Business: Instruction

to be Held

The annual general meeting of the Branch was held on June 10, following a show of two films from the Ministry of Health (blood transfusion and scabies). Dr. R. Spence presided at the meeting, when it was decided to establish a secretariat in Belfast. The report of the Branch Committee was adopted, stated that evidence in the form of the B.M.A. publication *General Medical Service for the Nation* had been submitted to the Select Committee on Health Services at Stormont; evidence from individual branches of the profession had also been considered. The following officers for 1934-5 were unanimously elected: president, Mr. C. J. Woodside; president-elect, Dr. J. W. Kilfer; vice-president, Dr. S. M. Bolton; hon. treasurer, Dr. Wm. Lyle; hon. secretary, Dr. Kane and Dr. F. Hainthly. After the meeting the president entertained members and four R.A.M.C. guests to lunch in the G. G. Lytle proposed the toast of "I Health of the President," and Dr. Spence replied.

NORTHERN IRELAND BRANCH

A fairly good response had been received to an appeal to doctors in Government service to join the Branch, as it had been found that only about 30% of practitioners registered in Ceylon were members. The report concludes with a reference to the difficulties of producing a journal during wartime.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 18 1943

Correspondence

Evolution not Revolution

SIR,—Dr. Anderson's address contains many excellent points, but he postulates a large number of fundamental changes in methods of practice which the profession "must" be ready to accept because, presumably, he thinks they represent the will of Parliament, and "Parliament is the mouthpiece of the people, and each section of the community should joyfully accept its decision." It should be pointed out that this Parliament was elected on issues which were already dead and out of date when war broke out in 1939, and that the people of this country have had no opportunity whatever of making known through Parliament their wishes on the issue which confronts the medical profession to-day.

In other words, from a democratic point of view no such revolutionary changes should be considered until a general election has been held. I do not advocate the holding of such an election now because it would obviously distract national energy and attention from the successful prosecution of the war. Furthermore, the present time with all its unnatural stress and tension does not provide the proper atmosphere in which people can calmly consider important questions of social and domestic policy. Why should there be all this rush and urgency? Assumption B presents problems which should be considered in a peacetime atmosphere and not at a time of emotional turmoil such as the present.

Very properly Dr. Anderson regrets that in the past the Ministry of Health and the Government have "shown little or no interest in our views and endeavours"—as regards adequate provision of medical services and the betterment of public health. What now makes him think that they will show any more interest in our views in the future? He has obviously sensed the widespread and increasing opposition among the rank and file to a State medical service, and puts it down to "a wave of emotionalism" and to an "ultra-conservative outlook" arising from the "premature disclosure" of the Minister's suggestions on the method of employment and remuneration of doctors. He says, "This is a pity." Is it? Might it not rather be a salutary warning of the sort of conditions we might expect if we allow this upheaval to take place during the war?

By all means let us consider and debate changes in the methods and organization of medical practice if we deem them necessary in the public interest, but let us do so when the war is over, and an atmosphere of peace and, let us hope, reason prevails! And however altruistic we may be as a profession, in considering the public interest let us not entirely lose sight of our own interests. The coming Annual Representative Meeting is likely to be a stormy one. I hope it will not be rendered more stormy by an agenda which

will leave it perfectly free to choose whether the profession shall, so to speak, (a) hang itself or (b) agree to being boiled in oil, all other motions and amendments thereafter falling to the ground.—I am, etc.,

Wolverhampton. A. VICTOR RUSSELL.

SIR,—The profession must thank Dr. Anderson for his address in the *Supplement* of Sept. 4. Although not altogether acceptable, it gives us some idea of the present inside views of the Council, who have the better of us in knowing the details of the recent discussions with the Minister; which details, I earnestly hope, will be published as soon as possible after the White Paper, when the imposition of secrecy by the Minister will no longer apply.

Dr. Anderson states that the Representative Committee gave the Minister "what it believes to be the views of the majority of the profession." Would it not have been far better for the committee to have known more precisely these views in advance? It is the omission of the B.M.A. to do so that has given rise to those independent committees that he deplors. I do hope that his opinion of the possibility of legislation on broad lines to be followed by regulations will prove wrong. One knows to-day only too well of the most unsatisfactory position of regulations passed by Government Departments with very little control by Parliament. We must insist that whatever legislation is envisaged the passing of the necessary Acts must wait until after the war, and when the country can be consulted in a constitutional manner. Discussions with patients fail to show that amount of cordiality that has been assumed. We shall most certainly need the mobilization of our resources to treat with the Government, but I submit that the need is now. It is a truism that revolution can take place exceedingly quickly but that time is necessary for the proper functioning of evolution.

Dr. Anderson's reassurances that in his opinion the Government intend to proceed with the main functions implicit in the Beveridge report are welcome, but would have been more so with an extant Government expression of their intentions in regard to conditions having a bearing on positive health. His remarks about private practice are most welcome, except the advice that we should accept the Government's decision whether the scheme should be for 90% or 100% of the population. The Representative Committee was overruled in that respect.

The explanations about the possibilities of some sort of control were far from satisfying, and the use of the word "direction" was far more frightening than "control." It is possible for the control to be delegated to the individual doctors in the scheme without any external control, central or local. What is wanted is integration.

In the tentative discussion about the possible methods of remuneration one agrees that there must be the prin-

ciple of payment for work done, but I fail to see why it must mean a capitation fee. It can as easily be an actual payment for each consultation and visit. I know it has been said that the Minister would turn that down as being the equivalent of giving the profession a blank cheque, but it would be far more fair to ourselves. Much is rightly made of the principle of free choice, but it is not emphasized that this should also apply to consultants. At the moment the success of a consultant depends on the service he renders to the patient and also to the general practitioner. Is this discriminating control to be lost?

Finally I would urge again that we ought to have not only a plan of campaign but also a plan in our minds of what we are prepared to accept and to get it brought to the notice of the Government before legislation shuts the door behind us; it may well be in a prison of our own omissions.—I am, etc.,

Wolverhampton.

L. B. PALING.

SIR,—With regard to Dr. Anderson's remarks on private practice I and others are very puzzled by his suggestions and how they are to be harmonized with the rules of medical ethics. Surely a patient who does not wish to transfer from the panel of Dr. "B" is that doctor's patient, and medical ethics prevent Dr. "C" from treating him. Also Dr. Anderson's suggestion visualizes a patient wandering for treatment haphazard between his "panel doctor" and a "private doctor." I can hardly imagine anything worse for all parties (even apart from medical ethics).—I am, etc.,

W. H. PALMER.

The Council's Recommendations

SIR,—In wartime all roads lead towards State control, hence the danger of planning in such a period. For notwithstanding plausible arguments to the contrary, and despite all the pitfalls, the abuses, and the imperfections, I hold that the safeguarding of individuality and individual enterprise is the only sure and certain path of progress, and indeed of human happiness. Holding these views, I welcome the report of the Council of the B.M.A. with as much pleasure as, let it be confessed, surprise. In particular do I applaud Recommendation B. This is one of those statements that a casual reader might pass over as a generalization requiring little reflection and no comment. Yet here are a short seven and a half lines deserving to be written in capital letters and containing a whole world of wisdom; here is the very marrow, not only of medical, but of all social reform.

So often in the working of our political system, and perhaps in the working of the British temperament, the real fundamentals of a problem become lost in a fog of side issues. In consequence the solutions are based on half-truths and faulty premises, and not infrequently bring in their train a number of other evils, yet leave the underlying mischief

unimpaired. To take an example, real education consists in the exercise of the intelligence, and should be progressive and life-long; yet money is poured out like water upon educating children whose subsequent lives will be spent, almost perforce, in following some soul-destroying and purely automatic occupation and whose intelligence exercise will be a twice-weekly sensation, largely sexual, at the cinema. In such circumstances intelligence withers and dies, leaving behind, all too often, frustration and bitterness. Again, selection of the best breeding stocks is practised by Nature and by man in every sphere of life with the sole exception of man himself. So long as this remains the case the phrase "positive health" is a farcical placebo. While not opposed to progressive change, I dare to think that the medical services as they stand at present compare very favourably with any of the other social services of the country. Yet they are being made a convenient scape-goat in the "freedom from disease campaign." Recommendation B is of infinitely greater importance than Assumption B; would that it might receive the same share of advertisement! Health depends on the exercise of the intelligence, and upon contentment, and contentment depends, *inter alia*, on freedom from care and upon contentment, and contentment depends, *inter alia*, on freedom from care. I, Some weeks ago Dr. Macdonald, writing as Chairman of the Representative Body, had a letter published in the *Manchester Guardian* wherein he stated (and N.H.T. to dependants would implement Assumption B. 2. Recommendation M of the Supplementary Report of Council takes a similar line to the above.

3. Dr. Dain (*Supplement*, Aug. 7, p. 21), referring to the 100% inclusion, suggested that whatever was done at the last A.R.M. there was no objection to putting forward new proposals. "Agreed, but surely the Council's duty is to carry out the resolutions of the last A.R.M. rather than to neglect them altogether in favour of new proposals in their declaration of B.M.A. policy.

4. A four-page circular has recently been circulated, signed by some members of Council, dissenting from the Supplementary Report of the Council.

5. Dr. Anderson, speaking in Manchester on Aug. 29 as B.M.A. Secretary, is reported thus: "My personal opinion is unhesitatingly that if Parliament decides on the 100% we should accept it." I submit that Dr. Macdonald, writing as Chairman of the Representative Body and therefore as a member of Council, ought not to advocate a scheme contrary to the resolution passed by the A.R.M. In his private capacity as Dr. Macdonald he can advocate anything he likes. So also in the case of Dr. Anderson; when speaking as B.M.A. Secretary surely what he says should be official—i.e., Council—policy, yet he offers what should be Council's policy as determined at the A.R.M. only as his private opinion.

The dissentient publication mentioned in 4 above is most confusing to the rank and file. Is its existence due to inability of a minority report? That would seem to be the only explanation.

It is obvious from all this that there is little unity at Headquarters. How, then, are the Divisions likely to achieve unity with the Council in the Representative Committee, and what faith can we place in that body, which will in all probability be the Negotiating Committee (if members have

State Medical Service

Sir,—It may be as well to point out now that when victory has been finally attained the indispensable service of thousands of civilian doctors in uniform will have made this a reality, as it is impossible to wage war without medical officers. The vast majority of these men are volunteers, but it is unlikely that they will consent to join a State medical service on terms such as those revealed in Dr. Hill's address in the *Supplement* of May 22 (p. 11) just to hand. In such a service they would be also indispensable, for on them success too would equally depend.

Bexley, Kent.
E. U. MACWILLIAM.

Sir,—The "Principles" put forward by the Council of the B.M.A. are most disapplying in that they do not properly reflect the very strong opposition that most doctors have to State medicine. I wish to express my personal misgiving. The panel service has little in its past to tempt one to perpetuate its method in the future.—I am, etc.,
A. GUTHRIE BADENOCH.

Wirksworth, Derbyshire.
E. D. BROSTER.

etc., individual enterprise and effort.—I am, the preservation of the individual and in interest in employment—in short, on depends on the exercise of the intelligence, and upon contentment, and contentment depends, *inter alia*, on freedom from care and upon contentment, and contentment depends, *inter alia*, on freedom from care. I, Some weeks ago Dr. Macdonald, writing as Chairman of the Representative Body, had a letter published in the *Manchester Guardian* wherein he stated (and N.H.T. to dependants would implement Assumption B. 2. Recommendation M of the Supplementary Report of Council takes a similar line to the above.

B.M.A. Policy

A. A. W. BEACH,
Surgeon-Lieut., R.N.V.R.
J. W. RAY,
Surgeon-Lieut., R.N.V.R.

If these terms of service and remuneration are the best that stay-at-home bureaucrats can devise we are tempted to ask, is this the democracy for which we are fighting? We view the future with considerable and increasing concern and not a little dismay.

Sir,—Some months ago there appeared in the *Journal* a leading article—B.M.A.—inspired, one assumes—urging on the profession the necessity for unity in view of the negotiations with the Ministry of Health. At the A.R.M. last year a resolution was passed which declared in favour of providing a medical service for 100% of the community. No. 32 of the Articles of Association of the B.M.A. lays down that the control and direction of policy of the Association shall be vested in the Representative Body, and No. 37 that the duty of the Council is to carry into execution resolutions passed by the Representative Body. Consider them, in view of the foregoing, the following.

1. Some weeks ago Dr. Macdonald, writing as Chairman of the Representative Body, had a letter published in the *Manchester Guardian* wherein he stated (and N.H.T. to dependants would implement Assumption B. 2. Recommendation M of the Supplementary Report of Council takes a similar line to the above.

3. Dr. Dain (*Supplement*, Aug. 7, p. 21), referring to the 100% inclusion, suggested that whatever was done at the last A.R.M. there was no objection to putting forward new proposals. "Agreed, but surely the Council's duty is to carry out the resolutions of the last A.R.M. rather than to neglect them altogether in favour of new proposals in their declaration of B.M.A. policy.

4. A four-page circular has recently been circulated, signed by some members of Council, dissenting from the Supplementary Report of the Council.

5. Dr. Anderson, speaking in Manchester on Aug. 29 as B.M.A. Secretary, is reported thus: "My personal opinion is unhesitatingly that if Parliament decides on the 100% we should accept it." I submit that Dr. Macdonald, writing as Chairman of the Representative Body and therefore as a member of Council, ought not to advocate a scheme contrary to the resolution passed by the A.R.M. In his private capacity as Dr. Macdonald he can advocate anything he likes. So also in the case of Dr. Anderson; when speaking as B.M.A. Secretary surely what he says should be official—i.e., Council—policy, yet he offers what should be Council's policy as determined at the A.R.M. only as his private opinion.

The dissentient publication mentioned in 4 above is most confusing to the rank and file. Is its existence due to inability of a minority report? That would seem to be the only explanation.

It is obvious from all this that there is little unity at Headquarters. How, then, are the Divisions likely to achieve unity with the Council in the Representative Committee, and what faith can we place in that body, which will in all probability be the Negotiating Committee (if members have

co-ordinated medical service which will give to its citizens the full benefits of modern medical progress and to medical practitioners the fullest opportunity of exercising their existing skill and of developing their own knowledge. The provision of such a service will require a radical measure of reconstruction which will give the general practitioners a much higher status and a fuller recognition as the central core of any efficient medical service."

Amendment by HOLLAND: That the following words be added: "That the State should carry out these functions in consultation with a medical advisory council consisting of representatives elected by the whole medical profession."

Recommendation E (Supplement, Sept. 11, p. 36):

Amendment by CITY: That the following be substituted for Recommendation E:

"This meeting is of the opinion that no lay authority should intervene in the doctor-patient relationship, but that a State which organizes and finances a service must have organizational control over it. Further, there is no evidence to show that the public is less well served by a salaried service, examples of which are public health, venereal diseases, and tuberculosis."

Amendment by Bournemouth and Winchester: That the first sentence be deleted, as this would apply only in a State Medical Service.

Amendment by BRISTOL: That the words "organization and" be deleted in the first sentence.

Amendment by St. Pancras: That the words "in their professional capacity" be inserted after the words "should not assume control of doctors" in the first sentence.

Amendment by Bradford: (1) That this meeting is opposed to a general practitioner and consultant medical service controlled by the State. (2) That the profession is not prepared to participate in any such service controlled by any local or regional authority through the medical officer of health or his staff, or otherwise.

Amendment by Worcester and Bromsgrove: That the profession rejects any proposal for the control of the future medical service by local authorities as at present constituted.

Recommendation G (Supplement, Sept. 11, p. 37):

Amendment by East Yorks and Leeds: That the recommendation be amended to read as follows: "That it is not in the public interest that the State should invade the doctor-patient relationship."

Amendment by St. Pancras: That the words "in the rendering of" be substituted for "rendering" in the second sentence.

Recommendation H (Supplement, Sept. 11, p. 37):

Amendment by Leeds: That the recommendation be amended to read as follows:

"That free choice of doctor should be reinforced by a method of remuneration which relates remuneration to the nature and amount of work done."

Amendment by City: That remuneration should be based on the amount and type of the work rendered, on ability and seniority.

Amendment by City of Edinburgh: That the word "and" be substituted for the word "or" before the words "the number of persons for whom responsibility is accepted."

Recommendation I:

That every member of the community should be free to consult the doctor of his choice either officially, as when he consults the doctor he has selected under an official service, or privately, as when he consults some other doctor, whether that doctor is a member of an official service or not. Nothing should be done to encourage the splitting of the medical profession into two groups—the official doctors and the non-official doctors.

Amendment by HOLLAND: That the following be substituted for Recommendation I: "Every member of the community should be free to consult any doctor privately, whether that doctor is a member of the official service or not."

Amendment by Harrow: That the recommendation be amended to read as follows:

"That every member of the community shall have the right at his own expense to request treatment as a private patient from any doctor other than the doctor on whose list his name appears under a scheme administered by the State."

Amendment by Oxford: That the recommendation be amended to read as follows:

"That every member of the community, whether entitled to avail himself of any official health service or not, should be free, if he so chooses, to utilize the services of the doctor of his choice, whether that doctor is a member of an official service or not. Nothing should be done to encourage the splitting of the medical profession into two groups—the official doctors and the non-official doctors."

Amendment by Worcester and Bromsgrove: That the recommendation be amended to read as follows:

"That every member of the community should be free to consult the doctor of his choice, either officially, as when he consults the doctor he has selected under an official service, or privately, as when he consults some doctor other than his official doctor, whether that doctor is a member of an official service or not."

Amendment by Kensington: That the first sentence, "That every member of the community . . . official service or not," be deleted.

Amendment by City: That all the words after "... consults some other doctor" be deleted and that there be substituted therefor: "Private practice can be adequately dealt with by those doctors in part-time employment in the service."

Amendment by Bristol: That the second sentence, "Nothing should . . . doctors," be deleted.

Amendment by Torquay: That the second sentence, "Nothing should be done . . . doctors," be deleted, as this appears to be a direct contradiction of the first part of the recommendation.

Amendment by Mid-Cheshire: That after "two groups" in the second sentence there be inserted the words "for personal medical services."

Recommendation J:

That consultants and specialists should normally be based on the hospital. For those persons who wish to be treated in private accommodation, whether part of a hospital or not, private consulting practice should continue as at present.

Amendment by Brighton: That the words "attached to" be substituted for "based on" in the first sentence.

Amendment by Kensington: That the second sentence be deleted, so that the recommendation reads: "That consultants and specialists should normally be based on the hospital."

Amendment by Birmingham: That after "wish" in the second sentence the words "for private consultation or" be inserted.

Amendment by Gateshead: That the words "as at present" at the end of the recommendation be deleted.

Motion by Eastbourne: That in the event of the introduction of a comprehensive State medical service, including specialist and consultant services, it should be possible for a patient to obtain nursing-home accommodation or private nursing attendance by extra payment, but that the specialist concerned should not be entitled to any extra payment.

Recommendation K:

That the central administrative structure set up by the State for the central administration of the

medical service in the future should be a body concerned only with civilian health services, but it should be responsible for all civilian health services administered by central government. The Minister to whom this central administrative body is responsible should be advised on medical matters, including personnel, by a medical advisory committee, representative of the medical profession. Locally, new administrative bodies, responsible to the central authority, should cover wide areas and should be representative, directly or indirectly, of the community served and, in appropriate numbers, of the local medical profession and voluntary hospitals. They should be advised on medical matters, including personnel, by local medical advisory committees representative of the local medical profession. These administrative changes should be regarded as foundation changes to be completed before other changes are initiated.

Amendment by Holland: That the recommendation be referred back to the Council for redrafting to make its implications beyond misinterpretation.

Amendment by Gateshead: (1) That in the first sentence the words "That the central administrative structure, which should be a corporate body, including adequate medical representation" be substituted for "That the central administrative structure set up by the State," and that the words "concerned only with the civilian health services administered centrally, and that it should be responsible for all such services but not for civilian health services not so administered" be substituted for the words "a body concerned only with civilian health services, but it should be responsible for all civilian health services administered by central government." (2) That in the second sentence the words "That the central administrative body should be advised on medical matters, including personnel, by a purely medical advisory committee elected by the medical profession" be substituted for the words "The Minister to whom . . . medical profession." (3) That in the third sentence the words "and voluntary hospitals" be deleted. (4) That in the last sentence but one the words "elected by" be substituted for the words "representative of."

Amendment by Northamptonshire: That the words "with adequate medical representation and should be" be inserted after "should be a body" in the first sentence.

Amendment by Leeds: That the first sentence be amended to read: "That the central administrative structure should be a body concerned only with civilian health services and should be responsible for all civilian health services."

Amendment by Newcastle-upon-Tyne: That the words "including personnel" be deleted from the second sentence, but retained in the fourth sentence.

Amendment by City of Aberdeen: That the words "by a medical advisory committee representative of and chosen by the medical profession, meeting at stated intervals and having the power to make its recommendations public" be substituted for "by a medical advisory committee representative of the medical profession" in the second sentence.

Amendment by St. Pancras: That (a) in the second sentence of Recommendation K, referring to local new administrative bodies, the words "appropriate numbers" be replaced by the words "appropriate proportion"; (b) in the last sentence the words "to be completed before other changes are initiated" be replaced by "and to be an essential part of any new arrangements."

Amendment by Isle of Wight: That in the third sentence the words "directly or indirectly" be deleted and that the following be substituted, "in equal numbers (1) of the community served, (2) of the local medical profession and voluntary hospitals."

Amendment by City: That the last sentence be deleted.

Amendment by Preston: That the words "whose chief executive officer should be a medical man" be inserted after "local medical advisory committees" in the last sentence but one.

Amendment by TORNAVY: That through out the recommendation the words "representative of and elected by the medical profession" be substituted for "representative of the medical profession".

Amendment by HARTLAX: That the following be inserted before the last sentence: "The medical members of the central administrative body shall be elected by the bodies."

Motion by WANDSWORTH: That it is essential in the public interest that any national medical service should be administered by a corporate body and not a Government department.

Motion by LESTER: That the following be substituted for "representative of the medical profession": "representative of the medical profession."

Department. Motion by Isle of Wight: That the medical person or local administrative bodies should have had at least ten years' experience of general or consultant practice. Motion by CLEVELAND: That all medical services at present administered by the State should be administered by the Ministry responsible for the health services and not by any other Department of the State. Recommendation L: That an

able that a detailed scheme for general practitioners should be framed and put into operation without corresponding arrangements for other branches of practice.

branches of medical practice should be amended to read: "That all amendments by the board of medical practice should be referred to the committee on the recommendation to be deleted. The remainder of the recommendation should be deleted."

words "it is essential that no detailed scheme for general practice" be substituted for "it is undesirable that a detailed scheme for general practitioners."

Motion by Harrow: That in view of the impossibility of implementing Recommendation M without a great increase of medical personnel, the term "Preliminary Proposals" be substituted for "Immediate Proposals."

Immediate Proposals

Amendment by Reigate: That Recommendation M be amended to read as follows: "That Assumption B should be satisfied persons and others of like economic status and to cover consultant and specialist services, always as general practitioners and laboratory and hospital facilities as well as general practitioners. Those persons with incomes above the existing limits could, if Parliament decided to make the service available to every member of the community, be permitted to become voluntary contributors to the extended service. A reconstruction of insurance committees would be required."

Insurance to include dependents of insured persons and others of like economic status whose income does not exceed £250 a year and/or £420 a year, provided that certain anomalies are removed, and that cover consultant and specialist services as well as general practitioner service." Amendment

Amendment by Swensen: That Recommendation M be amended to read as follows:

"(a) That in the meantime there should be an extension of the National Health Insurance benefit to include consultants, specialist services, laboratory and hospital facilities, as well as general practitioner services; (b) that these services should be available to all."

Amendment by Leaps: That any comprehensive medical service must be available to the whole community, with adequate facilities for contracting out.

Amendment by ISLE OF WIGHT: (1) That the following should be inserted after the words "general practitioner service" at the end of the first sentence:

(2) That the proposed extension would only be acceptable if the present capitation fee is raised to what the profession considers to be an adequate level."

"That if this group is included the cap-
tation fee for all insured persons shall
be proportionately raised."

Amendment by CLEVELAND: That the words "those persons with incomes above an agreed limit" be substituted for "those

persons with incomes above the existing limits" in the second sentence.

Amendment by BRADFORD: That a modified panel system with wider scope, a definite income limit, and accessory services available, be adhered to.

Amendment by ALDERSHOT AND BASINGSTOKE: That the words "provided that no changes be made in the income limit or terms of the National Health Insurance service without negotiation with the medical profession" be inserted after "extended service" in the second sentence.

Amendment by NOTTINGHAM: That the last sentence but one should read: "That if Parliament decides to make the services available to persons with incomes above the existing limits as voluntary contributors there should be a compensatory increase in the capitation fee."

Amendment by NORTHAMPTONSHIRE: That the following sentence be added to the recommendation: "While the Representative Body agrees with the foregoing recommendation, it desires to point out that a reconstruction of insurance committees will probably at a later stage lead to difficulties in the setting up of the administrative bodies referred to in Recommendation K."

Amendment by MID-CHESHIRE: That after "general practitioner service" the last paragraph be deleted and the following inserted: "That those persons with an income above the existing limits should be encouraged to make provision for medical services by joining mutual insurance schemes along existing lines."

Motion by EASTBOURNE: That there be no discussion with the Government on Recommendation M until a satisfactory remuneration be agreed upon.

Recommendation N:

That there should be initiated, by arrangement and agreement between the Government and the profession, organized experiments in group practice, including health centres of different kinds. Future developments in group practice should depend upon the results of such clinical and administrative experimentation.

Amendment by DERBY: That the recommendation be amended to read as follows:

"That medical services, in the main, should remain *in statu quo* until the introduction of a complete new service, or until, at a future date, a review of medical personnel and equipment should render some interim change both practicable and desirable."

Amendment by ISLE OF WIGHT: That the following words be inserted at the beginning of the motion: "That this meeting welcomes the principle of health centres and group practice and is prepared to collaborate."

Amendment by HOLLAND: That before the word "profession" there be inserted "local medical."

Amendment by OXFORD: That the recommendation be amended to read as follows:

"That there should be initiated, by arrangement and agreement between the Government and the profession, organized experiments in the methods of practice, such as group practice, including health centres of different kinds and general practitioner hospital units attached to general hospitals. Future developments in group practice should depend upon the results of such clinical and administrative experimentation."

Motion by NORTH STAFFORDSHIRE: That in the opinion of the Representative Body an efficient general practitioner service is not dependant on the establishment of health centres.

Motion by NORTH STAFFORDSHIRE: That it is the opinion of the Representative Body that the establishment of compulsory health centres would endanger the preservation of a free profession.

Motion by BOLTON: That the Government should be responsible for all the

expenses entailed in the organization of trial health centres, particularly in regard to premises and equipment.

Miscellaneous

Motion by NORTH BEDFORDSHIRE: That the Representative Body:

(a) is of the opinion that no steps should be taken to commit the medical profession with the Ministry of Health without first ascertaining the views of each member of the medical profession (at home and overseas);

(b) is satisfied that among the members of the B.M.A. there is, rightly or wrongly, a grave lack of confidence in the resolution and tenacity of purpose of the Representative Body and the Council to further the best interests of the public and profession, and that this grave lack of confidence is responsible for the existence of so many non-members in the profession;

(c) believes that a successful issue in the present business of the B.M.A. depends largely on the increase in (1) confidence in and (2) membership of the B.M.A., and that these ends will both be achieved by an Act of Faith by the Representative Body, Council, and permanent staff, communicated directly and individually to each medical practitioner on the Register;

(d) believes that this Act of Faith should take the form of a Declaration by the Representative Body, Council, and permanent staff that: (1) having considered a referendum and decided upon the best plan for a medical service for the public and profession they will not agree to accept any important modification without the authority of a new referendum to the whole medical profession; and (2) no one belonging to these bodies or permanent staff will accept any honour from the Government in respect of his services in connexion with the B.M.A. affairs;

(e) that the adoption of these resolutions does not necessarily imply a want of confidence in these bodies or the permanent staff;

(f) that as there appears to be great anxiety among members of H.M. Forces as to the method adopted by the B.M.A. to obtain their views, they should be circularized as to the nature of the steps proposed to be taken in this direction.

Motion by EAST YORKS: That the Representative Body, representing the great majority of qualified medical practitioners in the country, strongly deprecates the action of the Government in considering Assumption B (the comprehensive health and rehabilitation service for the nation) while not at the same time tackling the social security plan of Beveridge as a whole.

Motion by EAST YORKS: That the Representative Body, agreeing with the general principles of the Beveridge plan, strongly recommends that every effort be made to increase the number of qualified medical practitioners, and considers that to this end medical schools should be established at provincial university colleges where no facilities at present exist, but where the initial training could be given and ample clinical material is available.

Motion by OXFORD: That it is essential to increase the number of actively practising doctors, since without this increase the aims of Recommendations B (now A) and M of the Council cannot be realized.

Motion by GATESHEAD: That the following recommendation be inserted after recommendation L:

That the medical officer of health of any area should not act as the general executive officer of the administrative body in that area. His functions should be confined to matters of preventive medicine proper. He should work in close co-operation with the general practitioner service, but should not be responsible in any way for its administration.

Motion by WORCESTER AND BROMSGROVE: That inquiry be made as to whether the

number of practitioners at present available, or available on the cessation of the war with the release of Service personnel, will be sufficient for the implementation of Assumption B of the Beveridge report, and that Branches and Divisions be advised of any information available and of any views on this question.

Motion by EAST YORKS: That the Representative Body considers that the time is now opportune for discussions between Sir William Beveridge and a committee representative of the medical profession regarding Assumption B of the report.

Motion by TORQUAY: That the Representative Body is of opinion that in future negotiation with the Ministry of Health the British Medical Association should be represented personally at every meeting by Counsel experienced in Parliamentary procedure.

Motion by SHROPSHIRE AND MID-WALES: That it is imperative at the present stage in the evolution of medical practice that the British Medical Association should avail itself of the services of learned Counsel with medico-political experience.

Motion by SHEFFIELD: That the Council be instructed to retain the whole-time services of an eminent barrister who shall consider all proposed legislation affecting the profession, and shall advise the Council in all matters for negotiation with Ministers of the Crown and all Government committees.

Motion by NORTH STAFFS: That the Representative Body is of the opinion that the negotiating body to be set up should not commence operations without making it quite clear to the Minister that it reserves the right to make a full report of all proceedings to the Representative Body.

Motion by READING: That the Representative Body is not in favour of any secrecy in any discussions the Council of the B.M.A. may hold.

Motion by OXFORD: That in order to ensure the maximum personal and professional freedom and responsibility, no doctor shall be prohibited from or penalized for the expression or publication of his views on professional matters taken on the widest basis or of facts and figures learnt or discovered during his professional work, and that all medical advisory committees shall be free to publish their views and reports fully and independently of the views of the bodies they advise, with the single proviso that no material which might identify a particular individual shall be so published.

Motion by OXFORD: That greater efforts should be made to consult public opinion on the organization of the medical services through the various kinds of machinery now available.

Motion by OXFORD: That greater efforts should be made to instruct public opinion through the work of a salaried public relations officer of the British Medical Association.

Motion by HARROW: That the Representative Body is of opinion that to facilitate enunciation of the profession's views and proposals prior to the appointment of negotiators with the Government, a far larger proportion of the *Journal* should be made available for articles and letters on medical planning and public relations than has been available in the past.

Motion by BARNSTAPLE: That under any scheme of reorganization it is essential that the economical and social status of the practitioner should not be degraded.

Motion by NEWCASTLE-UPON-TYNE: That a national medical service which preserves the existing relationship of doctors and patients will demand of the doctors a high ethical standard on the matter of certification. One of the main causes of the present laxity is the intolerable increase in the number of certificates of every kind. Under a better organized service these should be much reduced and the profession should, at the same time, be prepared to accept any

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 25 1943

British Medical Association REPORT OF INSURANCE ACTS COMMITTEE, 1943

Five meetings of the Committee have been held during the past session. Dr. E. A. Gregg was reappointed chairman. In the interval between meetings the work has been conducted by an Executive Committee.

Insurance Capitation Fee

Panel Committees are aware of the persistent efforts which the Committee has made to secure a wartime increase in the insurance capitation fee, culminating in the Minister of Health's statement that his decision not to grant an increase must be regarded as final. The Minister's refusal was stated to be based upon Government policy, which was opposed to increases in remuneration for classes of persons with incomes above £550 a year. While the Committee was considering what further effective action could be taken it was announced that the Government had granted a war bonus to Civil Servants receiving salaries up to £850 (net) a year. Immediately the Minister was asked for an assurance that the Committee's claim would be reconsidered in the light of this decision. The Minister's reply is now awaited.

In the meantime a letter has been sent to Panel Committees explaining why the Insurance Acts Committee has not sought the views of insurance practitioners, through Panel Committees, on the issue of withdrawal from the service, a step which the chairman of the committee referred to at the Special Conference in March. The Committee's view is that the situation has changed materially since then. Following the discussions between the profession's representatives and the Minister of Health and his officers on the subject of a post-war national medical service, the indications are that the main issue is a State salaried service versus a two-way extension of National Health Insurance. Advocacy of an extension of National Health Insurance is advocacy of a capitation method of remuneration as opposed to the State salary method of remuneration. The Committee's view is that the larger issue of preservation of this capitation method of payment should not be prejudiced by withdrawal, or preparation for withdrawal, from a service remunerated by the capitation method.

A further reason for delaying action on this resignation issue has been mentioned already. The Government announcement that war bonuses were to be given to Civil Servants with salaries up to £850 a year has afforded an opportunity of reopening the general question of a wartime increase in the capitation fee, and the Insurance Acts Committee has taken advantage of the opportunity.

A Comprehensive National Medical Service

The views expressed by the 1942 Annual Conference on the Draft Report of the Medical Planning Commission were duly conveyed to the Commission. In December, 1942, the Beveridge report was published. In it Sir William Beveridge advocated a national social security scheme based upon certain assumptions, one of which, Assumption B, was the provision of a comprehensive health and rehabilitation service available to the whole community. Arrangements were then made for the appropriate parts of the report to be considered by the Representative Body of the B.M.A. and the Conference of Local Medical and Panel Committees. Before these two bodies had met the Beveridge report was discussed in Parliament, and Government spokesmen informed the House of Commons that the Government accepted, with certain reservations, the assumptions and principles of that report, including Assumption B. It was stated that the Health Departments would forthwith enter into informal and non-committal discussions with the sectional interests concerned, and the Minister of Health invited the B.M.A. to set up, in collaboration with the Royal Colleges, a committee representative of the profession as a whole to discuss with him the problems and difficulties involved in the establishment of a comprehensive medical service. A Special Representative Meeting of the B.M.A. and a Special Conference of L.M. and P. Committees, held immediately after a joint meeting of both bodies, approved acceptance of the Minister's invitation to enter into discussions without commitment, and the establishment of a Representative Committee to enter into such discussions on the understanding that, before negotiations were opened, the full machinery of the B.M.A.—including the Council and its Committees, Groups, Panel Committees, Divisions, and the Representative Body—would be used to consider the Government's proposal and to decide the Association's view thereon, and that every practicable step would be taken to give all members of the profession an opportunity to express their views.

The discussions with the Minister of Health and his officials were concluded in July and the Representative Committee presented a confidential report to its constituent bodies. In these discussions the Representative Committee was guided in general by the B.M.A.'s "General Medical Service for the Nation," the Draft Interim Report of the Medical Planning Commission reviewed in the light of criticisms and observations made by the constituent bodies of the Commission, and a number of general

principles. The Minister announced his intention to survey the position by the issue of a White Paper, which would in no way commit the medical profession. He was urged to confine his White Paper to a statement of the problems and not to commit the Government to any one solution of these problems. In this way there would be facilitated a free and frank discussion of problems by all concerned.

The Representative Committee reported that, on the Minister's ruling, the discussions were confined to the consideration of a comprehensive medical service available to the whole community. They ranged over a wide field of subjects, such as central and local administration, health centres, free choice of doctor, private practice, and methods of utilizing the services of medical practitioners (including methods of remuneration). Though the Representative Committee did not in any way commit the medical profession, it reached the conclusion that there should be an early statement by the profession of the fundamental principles that should form the basis of any future reorganization of health services whatever the contents of the White Paper.

Following the enunciation of basic principles by the Representative Body of the B.M.A., consideration will be given in the light of these principles to the White Paper immediately it is published. The Insurance Acts Committee will take special steps to consult Panel Committees on the subject-matter of the White Paper, culminating in a Special Conference called for the purpose. No negotiations with the Government will be started until after the Special Panel Conference and the Special Representative Meeting of the B.M.A.

Minute 18 of the Special Conference, urging that, in the event of negotiations failing to secure conditions satisfactory to the profession, the Council of the B.M.A. should be prepared with a plan for the treatment of the sick by the profession without its participation in the Government scheme, has been referred to a sub-committee for careful consideration.

The Rural Practitioners Subcommittee has had a preliminary discussion on the position of the rural practitioner under a post-war comprehensive national medical service.

Organization of Insurance Practitioners

Group Organization

In spite of the difficulties created by wartime conditions, some strengthening of the machinery for the organization of insurance practitioners is regarded as possible and necessary. To this end the Committee has recommended the forma-

tion of Group Standing Joint Committees in which they were not previously in existence and their revival where they have temporarily ceased to function. A Group Standing Joint Committee affords the Group Representative on the Insurance Acts Committee an opportunity of meeting representatives of his constituent committees and hearing their views on current affairs of interest to insurance practitioners. It is a means of so organizing an area that views can be conveyed to and obtained from every insurance practitioner in the Group within the shortest possible time. This is considered to be of vital importance, and a general outline of the procedure which might be followed was sent to Panel Committees in a circular letter dated Feb. 25, 1943.

Headquarters Organization

The Committee was asked (Minute 51 of 1942 Annual Conference) to consider a suggestion that a special N.H.I. section of the central secretariat and staff of B.M.A. House should be created. The Committee believes that such a central specialized department is likely to be less effective than a regional secretariat, which would allow a closer local contact and an adaptation to regional needs. Segregation of N.H.I. matters from other medico-political activities is not desirable. The ideal would be a system of regional organization with B.M.A. regional secretaries who would take an active interest in the problems of insurance practitioners within the region. The Council of the B.M.A. has been informed of this view.

Four methods of securing the most effectively presentation in Parliament of the views of the medical profession have been considered by the Committee. They are: (1) closer liaison with the present Parliamentary Medical Committee; (2) a closer contact with, and the bringing of, some present member who would speak and ask questions on behalf of the profession; (3) the sponsoring by the Association of the candidature of a medical man for the House of Commons (including taking all necessary steps, if he is elected, to enable him to devote his whole time to Parliamentary duties); and (4) the urging of representative doctors to Panel Committees to keep in touch with their local members of Parliament. The Council of the B.M.A. has been recommended that the third method is the one most likely to be of value and requested to take the necessary steps.

Public Relations

The Council of the B.M.A. has adopted the Committee's recommendation to review the Association's public relations activities, which were suspended at the beginning of the war. An adviser in public relations has been appointed and an information bureau has been established. The Department is now actively at work and already a good deal of useful work has been done, including the organization and briefing of local public relations committees in B.M.A. Division areas. Among the matters referred to the Committee by the 1942 Annual Conference was a proposal that an association of insurance practitioners be formed with the support of the B.M.A. The Com-

An Association of Insurance Practitioners

Committee is opposed to the establishment of such a separate body as being against the interests of the profession as a whole and of the sectional Groups within it. Investigation into Increase in Minor Illness

Arising from suggestions at the 1943 Annual Conference the Ministry of Health was asked to take all practicable steps to impress upon new entrants into the National Health Insurance the importance of joining a doctor's list without delay, and it was suggested that the name and address of the insurance committee be stamped on all copies of Form G.P.4 issued to doctors. The Committee is impressed that steps have been taken to form a "transferred workers" the importance of joining an insurance doctor's list immediately on transfer to their new quarters. Efforts have also been made to enlist the help of the new employers in ensuring that workers are aware of this facility. All new contribution cards coming into use in July, 1943, included advice on the subject of obtaining medical benefit. Form G.P.4 has been revised in accordance with suggestions by the Insurance Acts Committee and other improvements effected.

Medical Records of Discharged Service Personnel

The Committee has continued its discussions with the Ministry of Health regarding the availability of medical records of men and women discharged from H.M.I. Forces on medical grounds. The Service Departments have agreed to supply the Ministry of Health with copies of the reports by presidents of medical boards on persons so discharged except in the few cases in which consent to disclosure is withheld by the person concerned. The reports will be passed on to insurance committees and will be associated with the insured persons' medical records on reinstatement of an insured person on his former doctor's list or on his joining a new doctor's list, as the case may be. Individual insurance practitioners will shortly receive from insurance committees a communication giving full details of the arrangement.

Medical Treatment for Dependents of Service Men

Sickness Benefit during Pregnancy

Suggestions on this subject were made at the 1942 Annual Conference, with the general object of granting sickness benefit to an insured woman who, during the last weeks of pregnancy, is certified by her doctor to be unfit for work on account of pregnancy alone. The Ministry's reply is that benefit is payable for any period during which a pregnant woman is incapable of work. The Ministry does not feel that it would be

justified in relaxing the certification in so as to allow the certification of capacity at longer intervals than a week during the latter stages of pregnancy

Medical Representation on Insurance Committees

The Ministry of Health has noted Committee's request for increased representation of the medical profession in insurance committees, but states that it would not be practicable to deal with the matter at the present time. War Injuries of Insured Persons

The question of special payment for the treatment of insured persons suffering from war injuries was referred to the Committee by the 1942 Annual Conference and has been noted. In this connection Panel Committees are reminded that the Committee's request for increased representation of the medical profession in insurance committees, but states that it would not be practicable to deal with the matter at the present time.

Early Closing Hours of Chemists

Medical Benefit for Seamen

Pension Scheme for Insurance Doctors

The Pension and Insurance Scheme which was available for insurance practitioners until December last has been revised by agreement with the insurance companies concerned. Like its predecessor the revised scheme provides for pension, for family provision, and for disability. Full details will shortly be obtainable from the Medical Insurance Agency, B.M.A. House, Tavistock Square, London, W.C.1.

National Insurance Defence Trust

The balance sheet and statement of expenditure and income of the Trust for the year ending Dec. 31, 1942, is being sent to every Panel Committee. The trustees decided to act on the suggestion made at the last Annual Conference that the objective amount of the Fund should be increased to £1,000,000. Each area has been informed of its new quota, and so far 59 Panel Committees have agreed to make every endeavour to complete their quotas.

The trustees were asked by the last Annual Conference to consider and report on the desirability of defining more rigidly the conditions upon which grants for the assistance of aged or infirm insurance practitioners would be made from the Trust in pursuance of Minute 39 of the 1938 Annual Conference. The trustees have decided not to consider any further applications under Minute 39, and the following recommendation is submitted for adoption by the Conference:

Recommendation: That Minute 39 of the 1938 Annual Conference be rescinded on the understanding that grants already made will not be discontinued.

The Trust is sharing on equal terms with the B.M.A. the cost of the Public Relations Department.

SCOTLAND

This particular section deals with matters which are of a purely domestic Scottish nature and which have not been referred to in the preceding paragraphs or upon which action in England and Wales differs from that taken in Scotland.

Dr. J. F. Lambie (Glasgow) and Dr. A. F. Wilkie Millar (Edinburgh) were appointed chairman and deputy chairman respectively for the session 1942-3. Meetings of the Insurance Acts Subcommittee took place in December, 1942, and April, 1943. A special joint meeting of the I.A.S.C. with the Scottish Committee was held in March, 1943. A meeting of the Group Organization Subcommittee was held in July, 1943.

Group Organization

To ascertain the views of insurance practitioners in Scotland regarding the proposals of the Government for a comprehensive health service, a questionnaire was issued through the Panel Committees in January, 1943, to all practitioners in their areas. Arrangements were also made for meetings of practitioners to consider the questionnaire.

Supplementary Medical Service

The Committee was informed that the Secretary of State for Scotland had decided that what had hitherto been known as the Clyde Basin Scheme for diagnostic and hospital services had been extended to cover all other industrial workers in Scotland.

Mileage Returns

It was agreed with the Department of Health that mileage returns should not be asked for from practitioners during the current session.

Specially Expensive Drugs

A report was received that the Ministry of Health had agreed to increase by one-sixth the dispensing fees payable to insurance chemists, and that a corresponding increase had been made in the dispensing fees payable to doctors for expensive drugs supplied by them and the dispensing fees of doctors who did all dispensing for insured patients and who elected to be paid on the basis of the drug tariff. It was also reported that the Department of Health had given similar increases to chemists in Scotland, and that, accordingly, the position of dispensing doctors in Scotland had been adequately safeguarded.

Conference of Scottish Representatives

It was agreed that it be left to the Scottish Committee to ask the Council of the Association to sanction the holding of a conference on the advice of the chairman and vice-chairman of the Scottish Committee and the Insurance Acts Subcommittee and the Scottish Secretary when the time seemed most opportune.

Joint Meeting with Scottish Committee

A joint meeting with the Scottish Committee was held on March 18, 1943, which the Presidents of the three Royal Medical Corporations in Scotland attended by invitation. The business of the meeting was to consider the general situation which had arisen as a result of the proposals made in the Beveridge report. The following motion regarding the constitution of the Central Representative Committee was passed:

"That this combined meeting of the Scottish Committee and the Insurance Acts Subcommittee strongly protests against the method adopted to form a Representative Committee—i.e., the body in England set up to consult with the Minister of Health and his officers on the implications of the Beveridge report as they affect the medical profession—and considers that the proposal to submit to the Representative Meeting on March 31 and to seek its approval of the proposition that the Representative Committee adequately and properly represents the profession is not in accordance with the practice of the Association, in so far as most Divisions had not the time or opportunity to instruct their representatives in the matter."

At this meeting arrangements were also made for the election of a Scottish Medical Consultative Committee to discuss with the Secretary of State matters peculiarly affecting Scotland regarding a comprehensive medical service.

Public opinion on future medical services as voiced by a layman well versed in local public health administration deserves notice. A former convener of Glasgow Public Health Committee, Councillor John Stewart, speaking at the annual congress of the Royal Sanitary Association, said a properly organized system of health centres would mean the end of general practice as we know it to-day and of the N.H.I. system "with its vast army of approved societies, each having the right to decide its scale of benefits or to choose or reject members." The weakest argument, he said, in favour of retaining the present medical services was that about free choice of doctor. If a person had smallpox, typhoid fever, or enteric fever, which demanded special skill, he did not have free choice of doctor; his right was confined to the best skill and medicines to make him well, and that should be every citizen's right.

Correspondence

Sense with Sensibility

SIR,—Lately I have been asked to answer yes or no to yet another questionnaire. Like any reasonable being I cannot. You have published a mort of timid paranoic exhibitionism. I wonder if you would care to give space to a direct statement?

Medical men of sense and sensibility have listened to and discussed with interest the suggestion put forward from various sources that there is room for improvement in the health services of the nation. That is all that has happened. Any suggestions for improvement will be discussed without panic by the mentally stable.—I am, etc.,

Godalming

TERENCE TURNER.

Conservatism in Medical Practice?

SIR,—It is a truly deplorable state of affairs when a physician, in order to make a living, has to have so many patients that he is unable to devote sufficient time to the individual to examine the psychological aspect of his illness. The result is that many cases of industrial fatigue, psychoneuroses, maladjustment are labelled anaemia, gastritis, nervous debility, and the like. They are then given some innocuous medicine which helps to form a fixed delusion of physical illness and soon become chronic invalids. We in industry see many such cases, whose cure can be rapidly effected by a hunt for temperamental causes, an explanation of them, and possibly the adjustment of working conditions. This unfortunate state is brought about by the parsimony of the panel system, which prevents the doctor from being a real clinician and makes him a medicine pedlar.

I can see no alleviation of this tragic fate until the doctor has time to give each patient a proper investigation, to read and digest current medical journals, to attend classes at medical schools, and to have some leisure for his own recreations. He must also have an income and a pension which will allow him to practise his art honestly without anxiety of making present ends meet and at the same time endeavour to safeguard the future. This is an impossibility with medical practice as it now is. The era of the "family doctor" is coming, I hope, to an end. The public expects, and deserves, the doctor to be a man of science rather than a kindly gentleman who soothes a fractious child, has a good bedside manner, and prescribes a good bottle. One wonders how many cases of tuberculosis are fed with nice tonics for a year before any serious attempt is made to find out why the child is just not thriving.

The objections to a State Medical Service seem to be two in number: (1) that it would eliminate the free choice of doctor, and (2) that it would lead to endless pen-pushing and bureaucratic control. Surely, Sir, there is no reason why free choice should be less with a State service than it is now. In a small village where there is now only one doctor there will be no less free choice than there is at present. In the large town there will be as much free choice; the only difference will be that when the chosen doctor is having his well-earned day off a deputy will be found much more rapidly, and

most of us would feel, I think, that, apart from the relief of pain, we had comparatively little to justify our existence as medical practitioners. Surgery has its own brilliant achievements, but here, too, efficiency is becoming more and more conditioned by this ever-widening outlook.

It is self-evident that no individual can assimilate and himself apply all this new knowledge to the cure or relief of his patients. Some years ago we heard a good deal about team work; and certainly team work is now more than ever essential. But I suggest that teams have been and are, with certain notable exceptions, working in separate compartments. Public health laboratories, for example, while doing very valuable work by assisting in the diagnosis and prevention of disease, seldom come into direct contact with the patients upon whose ailments they are asked to report, and not very often with their doctors. It seems probable that in the proposed health centres the clinician and his colleague—the biochemist, bacteriologist, radiologist, or other specialist—would have an opportunity of meeting and perhaps seeing the patients and discussing difficult problems; thus the interest and keenness of both would be stimulated and they would be, more likely to arrive at correct conclusions.

It may be suggested that such health centres as I visualize would cost a good deal of money. They would. But if we can spend thirteen or fourteen millions a day on the war, there is surely little doubt that money would be forthcoming to secure the most efficient treatment possible for the masses of our fellow citizens. Their health and working capacity mean comparative comfort in their homes and reasonable security against semi-starvation. I may add that I have little sympathy with the fears of many of my friends that the evolution or revolution foreshadowed in the Beveridge report will seriously reduce their incomes. On the contrary, it is a truism in business that if you want a really good article of any sort you have to pay more for it than a shoddy one. And our rulers are very capable business men.—I am, etc.,

Manchester.

J. STAVELY DICK.

Politics or Statesmanship ?

SIR,—It would seem that the general desire for the best medical service for everyone is being exploited to promote the smaller interests of: (1) the Government, in its anxiety to keep its prestige by adopting some part of the Beveridge plan; (2) the Ministry of Health in its determination to gain complete control of the medical profession and so realize the ambition it has pursued for twenty-five years; (3) a section of the Labour Party which, in its hurry to gain political credit by demanding equal treatment for all, cares less that that treatment shall be good than that it shall be universal.

Though the health of the country is not in a precarious state and though medical planning must so obviously require time and consideration, there is every appearance of urgency on the part of the Government to bring a State Medical Service into being immediately. This haste is not stimulated, approved, or shared by the people or by the doctors, and is due to the facts that the medical profession, though always the easiest profession to attack, is only defenceless at the

present time when it is disrupted and its members scattered by service in the war, and the Government, etc., must act now if they are to attain their ends.

Again, if the Government were sincere it would be content to gain experience by building a first-class panel service, but it will have nothing to do with such a scheme, though the panel has always been a poor and mean service, in which there has been no effort at any time to make satisfaction in it a possibility. Moreover, the Government has the equipment for the lesser venture now, but will have no possible means of carrying out the larger scheme till long after the war has ceased.

One feels that to attempt to manoeuvre national interests for political ends is a fraud and breach of faith on the part of the Government, and belies every promise it has made for democracy.—I am, etc.,

London, N.W.S.

H. J. S. MORTON.

Sale of Goodwill of Practices

SIR,—At a time like this, when all aspects of medical practice are being closely scrutinized by the public, I suggest there is one internal reform which the profession could carry out to its credit with the nation generally. The profession should discountenance the sale of the goodwill of private practices. A consultant or a specialist is not normally expected to sell his goodwill, and this would not normally be tolerated by his colleagues. A general practitioner has presumably asked a just price from his patients for his services. Why, then, should he demand a capital sum to be exacted from his successor? His successor has no right to ask more than a just price from his patients, but if he does this he is entitled to the whole yield of his labours.

The sale of goodwill is a piece of "unhandsomeness" unworthy of a profession which has higher standards than those of competitive rapacity. So far as I have been able to observe over a period of twenty years, the sale of goodwill is not conducive to amity and good will among the profession, and is a cause of scandal among the public. The tendency of a man anxious to sell out is to inflate the yield of his practice by all possible means. He will seize every opportunity to increase fees to the limits of his patients' tolerance. This would not be tolerated for a long period, but it is successful just long enough for the vendor to make his "get-away" with a capital sum. For the purchaser it means buying the "badwill" of such tactics. It is not enough to repeat the maxim of the hucksters of the market-place, *Caveat emptor*; there is a *Caveat vendor* fatal to the amity of the parties concerned. Moreover, it involves that for the sake of a lump sum at his own "get-away" the vendor actively canvasses his patients on behalf of the new-comer paying him the lump sum. After all, if a man wishes to retire from practice in a neighbourhood, in which presumably he has been a known and respected figure, asking only the just price for his services and getting that price, the men most suitable for treating his patients when he retires are his colleagues who are already in the neighbourhood and whose qualities are known. What right has he to boost a new-comer because he is being paid to do so? The introduction of a new-comer is a matter which is the con-

cern of the whole profession in a neighbourhood, and equitable arrangements could be devised by them for his introduction.—I am, etc.,

London. N.15.

E. H. STRANGE.

Bristol's Views

SIR,—I enclose a copy of a questionnaire sent out by the Bristol Study Group to all Bristol doctors. Figures for or against each question are inserted. I also enclose an analysis of the answers compiled by a subcommittee of the Study Group.

- (1) Are you in favour of a salaried, whole-time, State-controlled service? .. 84% against
- (2) Are you in favour of extension of National Health Insurance to include the whole population? .. 71% against
- (2a) I so, do you consider that the approved societies should extend their present functions to include the whole population? .. 80% against
- (3) Are you in favour of a part-time Government service available to the whole population and open to all registered practitioners? This includes the continuation of private practice .. 25% against; 75% favour
- (4) Should central administration be:
- (a) A centralized Ministry of Health to include all departmental health services? .. 72% against
- or (b) A public corporation similar to the B.B.C., the Unemployment Assistance Board, or the London Passenger Transport Board? .. 78% against
- or (c) A Minister of Health with a *strong* medical advisory board? .. 50% against
- (5) Would you prefer to work under:
- (a) A local health committee (which, however organized, is still a popularly elected body)? .. 90% against
- or (b) A regional health committee, or an appointed body with adequate medical representation? 23% against; 77% in favour
- or (c) A regional officer of the Ministry of Health? .. 87% against
- (6) Are you in favour of health centres in your own locality? .. 27% against; 73% favour
- (7) Would you consider an adequate salary for a general practitioner in a whole-time State salaried service? £350-£500, 9.6%; £1,000-£1,500, 41.6%; over £1,500, 17.0%.
- If the service is part-time, are you in favour of:
- (a) Basic salary? .. 72% against
- or (b) Capitation rate? .. 61% against
- or (c) A combination of both? .. 54% against
- If the service is an extension of N.H.I. to include the whole population what do you consider an adequate capitation fee? Under 15s., 7.9%; 15s.-25s., 28.0%; over 25s., 4.0%
- (8) The *responsibility* in which you are engaged:
- (a) General practice .. 85% of 250
- Consultant practice .. 35 out of 70
- Public health .. 19 out of 40

Analysis of Answers

The results of the questionnaire show very clear-cut answers to all except two. On the question of central administration opinions were divided. This was so partly perhaps because, in an attempt to be concise, the questions were framed too concisely; partly because the profession has not made up its mind about central administration, or does not know enough about existing control to visualize possible alternatives.

The other question on which there was a wide range of opinion was that on remuneration. There were doubts as to the value of money after the war; the possible cost of living; the rate of income tax; and the degree of restriction on the number of patients to be accepted. These provided too many variables, but it is evident that the majority of the profession expect a net income of about £1,500, and consider that to do good work the capitation rate should be at least 15s. It is to be noted that the bulk of general practitioners preferred a capitation rate, either alone or combined with a basic salary.

Other observations to be made are that the profession in Bristol is against a whole-time State Medical Service or an extension of N.H.I. under present approved societies, but in favour of a part-time service and private practice.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 2 1943

British Medical Association

ANNUAL REPRESENTATIVE MEETING, LONDON, 1943

The Annual Representative Meeting was held on Sept. 21, 22, and 23 in the Great Hall of B.M.A. House, London. The chair was occupied by Dr. PETER MACDONALD, who was supported by the new President (Lord Dawson of Penn), elected to that position at the opening of the meeting, the Chairman of Council Mr. H. S. Souttar, the Treasurer Dr. J. W. Bone, and the Deputy-Chairman of the Representative Body Dr. J. B. Miller. Every home Branch of the Association had its full complement of representatives.

On the first morning ordinary Association business was taken and was completed on the third morning. The debate on "The Future of Medical Services," on which there were 227 motions and amendments on the paper, was opened in the afternoon of the first day, continued throughout the second day, and was completed on the third. There follows the first instalment of the summarized report of the proceedings.

Tuesday, September 21

The Presidency of the Association

The CHAIRMAN OF COUNCIL expressed the deep loss which the Association had sustained in the death of its President, Sir Beckwith Whitehouse. "To be called away in the fullness of his powers, in the very execution of the work of his high office, is an end we might all envy, but to us who remain the loss is poignant and very real. . . . The Association has never had a President more apt to the duties of his office or more ready to render it any service in his power." The representatives stood in silent tribute.

Mr. Souttar then brought forward the unanimous recommendation of the Council that Lord Dawson of Penn be elected President. He said that Lord Dawson, in spite of his many duties, had intimated his willingness to accept the invitation. He was President in the centenary year (1932); this was the first time that a Past-President had been recalled after an interval of years to serve a second term. The Association would be fortunate in having at its head the doyen of the profession.

The recommendation was agreed to unanimously, and at a later stage in the meeting Lord Dawson attended, was warmly greeted, and expressed his thanks.

Association Progress

In submitting the Annual Report of Council Mr. SOUTTAR drew attention to the increased membership. On December 31 last the membership stood at

41,239; the present figure was 44,288, a gain of over 3,000 members in less than nine months. The Association had taken its full share in the war effort. The loss of many members on war service was deplored; a very large number were serving with the Forces. He was not allowed to reveal that number, but if he were to do so it would warm their hearts. He also referred to his own recent mission to India; in the course of the journey he was able to see many of their members on service—in North Africa, Egypt, Iraq, and India itself—and everywhere they were a magnificent credit to the profession. The Association had carried through a great undertaking in finding doctors for the Army, and here he paid a tribute to the work done by the Central Medical War Committee and its subcommittees and by the staff of the Association.

The TREASURER (Dr. J. W. Bone) submitted the Association accounts and balance sheet. Heavy expenditure was being incurred in three directions—namely, in the reconditioning of a wing of the Association House, the demolition of dangerous parts of another wing which had been damaged by enemy action, and the considerable increase in local activities. The Divisions were now particularly active, and this entailed expenditure. Notwithstanding all these calls upon its exchequer, however, he believed that the present year would end without any debit balance, ample reserves had been made, practically all debts had been cleared off, and their position was that of an exceedingly flourishing body. "We are prepared to pay the piper for any tune which may be called."

Dr. LUCAS YOUNG (Eastbourne) moved to refer it to the Council to frame an amendment to the by-laws whereby the reasonable expenses of representatives (in addition to first-class travelling fares) would be defrayed from the general funds. The TREASURER pointed out that if this were conceded they must proceed logically to pay the expenses of members of Council and standing committees and of those who worked for the Association in the constituencies. Moreover, what were "reasonable expenses"? Might they be held to include, in addition to subsistence allowances, the payment of locumtenents?

It was agreed, without pressing for a new by-law, to refer the whole matter to Council.

National Health Insurance

Dr. E. A. GREGG, in submitting the report under "National Health Insurance," said that the question of the capitation fee was still being pursued. The granting of a bonus to civil servants receiving salaries up to £850 a year

suggested a change of policy on the part of the Ministry, and the Insurance Acts Committee had taken advantage of the occasion to open up the question again, and was now awaiting the Minister's reply. The Committee was also co-operating with the Public Relations Committee of the Association to ensure that matters particularly affecting insurance practitioners received due attention. A pensions scheme to all intents and purposes similar to the scheme formerly in existence had been worked out, with the difference that in view of present conditions higher rates were payable, but it was believed that the form of pension was the best obtainable at the present time.

Medical Fees

Dr. S. WAND submitted the report under "General Practice." The General Practice Committee had had a busy session and had dealt with a large range of subjects. He also brought forward a matter not mentioned in the report and of which the Association had received intimation only that morning. The Home Office proposed to raise the capitation fee paid for the treatment of ex-regular firemen whose conditions of service entitled them to free medical treatment to 12s. 6d. per annum as from Oct. 1. The Home Office also suggested that this would be an excellent opportunity to bring into operation a graduated scale of payment in respect of higher ranks—namely, leading fireman, section leader, and company officer 12s. 9d.; senior company officer, column officer, divisional officer, and assistant fire force commander, 16s. 3d.; and fire force commander and above, £1 2s. 3d. Dr. Wand stated these proposals would be considered by the Council. The fees of Post Office medical officers had been increased to 12s. 6d. as the basic capitation fee in respect of personnel earning less than £250 per annum, with higher fees for personnel above that rate of pay.

Dr. R. S. BROCK (Denbigh and Flint) moved for an increase in fees for life insurance examinations—namely, a minimum fee of £2 2s. for full examination and report upon life proposals and a fee of £1 1s. for reports upon medical histories in which medical examinations were not required. Dr. WAND said that the executive committee of the Industrial Life Office Association was a very difficult body from which to obtain concessions, and he felt that no useful purpose would be served at this juncture by such an approach. They were apt to say that doctors were "falling over themselves" for the £1 1s. insurance fees.

It was agreed to proceed to the next business.

A number of motions were on the paper on the question of certification.

but only one of them was carried, moved by Cleveland, declaring that in view of the present shortage of medical manpower the Council should take all non-medical work (certification) required of practitioners.

posed a motion bearing on the capitation payment for N.F.S. and Civil Defence personnel. Its principal recommendation was that a capitation fee of not less than 9s. 9d., exclusive of drugs and dressings, should be payable. He argued that the terms should not be lower than National Health Insurance rates: the acceptance of a smaller fee would weaken the hands of the Insurance Acts Committee and would have an unfortunate effect on the remuneration of Dr. Ward hopped that services.

The matter has just made its way from the Home Office to the Isle of Wight Council, to make this a reference to the Post Office workers and now there were certain respects, such as contracting illness, where service on a contract basis would be a disadvantage from the service on a full-time basis.

The matter has just made its way from the Home Office to the Isle of Wight Council, to make this a reference to the Post Office workers and now there were certain respects, such as contracting illness, where service on a contract basis would be a disadvantage from the service on a full-time basis.

referred, and of these 138 had been successful and 17 were still pending. In 7 cases they had been unsuccessful; in these it was discovered that the doctor had either help or there were circumstances which were not favorable.

There was no doubt that local officials were now much more appreciative than Dr. D. J. Morrison (Edinburgh) urged that the profession should take up the question. Dr. A. Beauclaire (Birmingham) said that the part-time assistance which the Ministry of Labour proposed to arrange was only a small way to meet the situation. Dr. A. Gregory (Manchester) said that there was a risk of surgeons having to consent to a small number of operations.

The result of application for labour exchanges was "shied off" as soon as the woman sent who saw the house and the work known to Dr. J. C. Arthur mentioned that in 1939 at conference held in that hall consisting of 12 members of the Trades Union (instead) mentioned that in 1939 at

But the Association should con- sider something of the kind for the local office of the Labour Party. Where the Local Medical Committee had established good relationships with the local doctors, assistance should be sent to hard-pressed doctors. Where the Local Medical Committee had established good relationships with the local doctors, assistance should be sent to hard-pressed doctors. of scoliosis and lordosis among children coming into industry. He pleaded for definite training—games by themselves were not enough—based on sound reasoning and a realization that if thought and care were not taken in the matter of standing upright, gravity would exercise its pull and the position and action of organs would undergo interference. Sir KAYE LE FLEMING asked whether the speaker had read the report of the B.M.A. on physical education. Dr. LEAK replied that he had done so, but he thought a further effort should be made to impress this matter on the Government.

The motion was carried.

On the proposal of Dr. J. B. MILLER (Lanarkshire), Prof. PICKEN undertook that the Council would look into the question of amending the present superannuation scheme for medical officers of the public health services so that: (1) wives of contributors might be included in order that the benefits and pension rights due to an officer should on his death be continued to his widow; and (2) the retiring age for officers might be reduced from 65 to 60 years.

Organization of the B.M.A.

Dr. J. C. MATTHEWS moved certain alterations in the by-laws which will have the effect of altering the constitution of the Scottish Committee. Any member of that committee, even though not a member of Council, may be appointed chairman, but if not a member of Council the committee may choose a member of Council as deputy chairman. All members of Council resident in Scotland become *ipso facto* members of the Scottish Committee. The committee is also empowered to co-opt three members. Dr. MARGARET MARTIN (Edinburgh) moved for a further provision whereby the Presidents or one nominee from each of the three Royal Medical Corporations in Scotland would be members of the committee. She said that the prestige of the Association in Scotland would be assisted by close co-operation with these corporations. Dr. G. MACFAR (Lanarkshire) supported this proposal, saying that the Corporations had come into consultation with the Scottish Committee during the past year to a greater extent than ever before. Dr. MATTHEWS pointed out that the acceptance of this amendment would delay the reconstitution of the Scottish Committee for another twelve months.

The alterations in the by-laws were agreed to, and it was referred to Council to consider the point brought forward by Dr. Martin with a view to framing a further amendment.

Dr. W. V. SEMPLE (Lincoln) moved that arrangements be now made to appoint full-time regional secretaries, who could take up their duties as soon after the war as possible. Such appointments would be necessary for the protection of members' interests when the new medical service took shape, for those interests would have to be taken care of locally, not centrally. The major qualification of such a regional secretary was that he should have had at least 15 years' experience in general practice and should be not more than 50 years of age. Dr. MATTHEWS said that he was entirely in favour of this proposal. Had it not been for the war it would have matured before now, and he reminded the meeting of the appointment of the late Dr. A. Keith

Gibson to the London region. The proposal was carried.

Dr. D. G. GREENFIELD (Northamptonshire) moved that every candidate for election to the Council should publish in the *Journal* or by letter a statement of his views and policy. Not 5% of the people who had to vote knew the candidates. He agreed, on Dr. Matthews's suggestion, to refer the matter to Council.

Dr. D. O. TWINING (Plymouth) had a resolution calling for the more direct association of the Divisions with B.M.A. policy and for quarterly Representative Meetings. Dr. J. B. MILLER pointed out that the Council itself met four times a year, and to have four Representative Meetings would do away with all interest in the Annual Meeting. Dr. E. B. SMITH (Nottingham) suggested as an alternative more frequent meetings between Council representatives and their constituents, but was answered by Mr. A. S. GOUGH (West Herts) to the effect that it was impossible at the moment for any Council member to keep in full touch with his area.

The Plymouth motion was lost, but a further motion by Plymouth, calling for consideration to be given at an early moment to the election of Council on a more direct and better geographical basis, was accepted by Dr. Matthews and agreed to by the meeting.

FUTURE OF MEDICAL SERVICES

Work of the Representative Committee

At this point, by previous resolution, the meeting turned to the consideration of the many motions and amendments on the future of medical services, and in particular of the 14 "Principles" set out in the Supplementary Annual Report of Council (Supplement, August 7, p. 19).

Mr. H. S. SOUTTAR, Chairman of the Representative Committee, said that the medical profession was faced with the most important crisis in its history. The future of medicine in the new social epoch held vast possibilities, but to bring them to fruition would demand wisdom, patience, and not a little self-sacrifice. When it was realized that in their hands might lie the whole future of their great profession, none of them would grudge the effort or allow the personal interests of the moment to blind his vision.

He went on to recall the formation of the Medical Planning Commission in May, 1941. Its interim report met with a gratifying general approval, and it was the intention of the Commission to elaborate the details of its proposals, when there was suddenly launched upon them a thunderbolt in the shape of the Beveridge report. The proposals of that report were for the most part admirable, but when the Government set out to give effect to the proposals which affected the profession a different situation arose. "Our axiom that a first-class medical service should be obtainable by every individual, whatever his economic status, is expanded into the proposition that no one is to pay for our services. Our desire to work together in groups is converted into regimented service under a local authority."

He believed that it came quite as a shock to the Government to find that the medical profession had ideas of its own as to how its affairs should be managed and was by no means willing to accept the dictation of any Ministry. But once that idea was grasped the Minister of Health expressed himself most willing to hear their point of view, and an authoritative body was formed which carried on

most intimate and candid discussions with the Ministry for four months. As a result there was reason to believe that the views of the Ministry had been greatly modified, and that the proposals presently to appear in the White Paper were much more likely to meet with the approval of the profession. But for what would appear in the White Paper the Minister was wholly responsible.

Meanwhile, however, the profession could not adopt a negative attitude, and the conclusions of the Representative Committee and of the Council were crystallized into the "Principles" now before the present meeting. These were only general principles; the details would be filled in later, but he hoped that time would not be wasted on mere verbal changes. After the White Paper was published a special Representative Meeting would be called upon to form a negotiating body to prepare proposals for final consideration. The "Principles" were based upon the accepted policy of the Association. The meeting was asked to review them in the light of the new conditions which had arisen, to make such amendments as were desired, and to approve them as a basis for future negotiations. They covered a wide field and defined their position as regards the unity and completeness of the service, free choice of doctor and free relation of doctor and patient, responsibility of the State for the service and its administrative control, the position of general practitioner and consultant as members of the service, and the method of their remuneration.

Before these general principles were reached, however, a clear-cut decision on the question of a whole-time salaried service was desirable. No doubt from the administrator's point of view such a service presented many advantages, and in certain fields of practice, such as public health, it was accepted by all. But it would be opposed to the traditions of general and consultant practice, and he did not think that most of them would favour the experiment; they would prefer to develop in the future on the lines so well laid in the past.

90% or 100%

Dr. J. D. R. MURRAY (Exeter) moved the first amendment:

That the Representative Body views with grave apprehension the institution of a comprehensive health service available to the whole community, believing that the time is not yet ripe for such a service, which would be neither in the interests of the public nor of the medical profession.

It was in no spirit of criticism that this motion was put forward. He had had many opportunities of discussing with his own patients the possibilities of a future medical service with the inclusion of dependants and the provision of consultant and specialist treatment and had heard no unfavourable comment. This ideal could be achieved by the extension of the National Health Insurance system. But the "10%" did not want to come under a "glorified panel." He had yet to come across a member of that "10%" class—and they had more than their fair share of them in Devon—who wished to alter the present relationship.

Dr. P. INWALD (City of London) opposed the motion. Such a motion came too late in the day. The times in which we were living were momentous. Epoch-making changes were about to take place in industry and in the professions. He begged the medical profession to manifest a statesmanlike view, bearing

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

at the present moment. Otherwise they laid themselves open in the eyes of the public—a public whose good will they needed as never before—on the suggestion that they wished to exclude one section of the community, the best-off section, the best-off group.

[illegible]

Every one of the points raised would have come more appropriately under later sections of the agenda. He appealed to the meeting not to throw out this resolution, but, if Exeter agreed, to allow it to be withdrawn. (Applause.) The representative of Exeter, who said that the position of the motion on the agenda was not of his choosing, was willing to withdraw it, but the proposer of the amendment was not willing; therefore the chairman accepted a motion to adjourn.

proceeded to the next business, and this was carried. The Chairman gave an assurance to Dr. Dain that the meeting would have an opportunity later of deciding on a definite resolution, whether it was in favour of "100%" or less.

of such a procedure would prevent discussion in the profession. They had been

fold of the phenomenal increase in the membership of the Association, but did not alter the fact that when the White Paper proposals were published they medical appeal to large sections of the Representative Body, including not only the most progressively minded but some who might be described as "diehards". There might be a swing of opinion right away from the recommendations in favour of what were considered the more favourable conditions offered in the White Paper. If that happened, the history of 1911 would repeat itself, with great loss.

A further point was the incompleteness of prestige to the profession and a considerable deterioration in its powers of negotiation in the future. Doctors in the Services, too, had a right to be consulted.

f their own case—an incompleteness which might be thrown into high relief when the White Paper was published. It might then appear that the Council had given rather scant attention to a number of important points. It must not be forgotten that the Minister had been in consultation with other bodies, including associations of local authorities and of voluntary hospitals.

Mr. SOUTTAR said that Stratford had not learned the strategy of war. The first need in war was to have the initiative. Here they were laying down the policy which they wished the Ministry to adopt, not waiting for the Ministry to lay down its own directions. The Minister had many other considerations to take into account, and it was for the profession surely to form its own opinions as to what should be the best medical service for the country and to get the country to agree to it. Then the Minister would follow their lead.

The Stratford motion was lost by a large majority.

Dr. E. BABST (Tyneside) moved that the recommendations be not approved until the Representative Body "is assured that the Council intends to uphold the present economic and professional standing of general practitioners." There were two points on which his Division was anxious—namely, that there should be financial security for the profession, and that its professional standing should be adequately protected. During the past few months articles had appeared in the Press, inspired or otherwise, hinting that practitioners willing to participate in the Government scheme would begin at a salary of £400 a year, rising by yearly increments to £800, which latter figure he assumed to be the maximum to be given to practitioners of experience and standing. This was entirely inadequate, and some of them felt that their financial security was threatened, and that their incomes might be reduced by one-third or one-half. What incentive would there be for their children to enter upon a medical career? As for professional standing, the profession objected to be regimented, directed, or controlled by local bodies. They should be allowed to continue to practise how and where they liked.

Mr. SOUTTAR said that he was prepared to accept the motion if the word "present" were withdrawn. He hoped that in the future the economic and professional standing of the profession would be greatly advanced. The Council certainly would do everything possible to uphold it.

The word "present" was withdrawn, and thus amended the Tyneside motion was carried.

The Members in the Services

Dr. BALFOUR BARROW (Winchester) had a motion opposing "any fundamental change in the medical profession during the absence of so many members in the Services." He said that this motion originated from the Service members themselves at a meeting in his district. Their fear was that on demobilization they would find that fundamental changes had taken place so that they would be unable to recognize the practices they had left.

Mr. SOUTTAR said that this matter had received the greatest possible consideration from the Council. But it was not sufficient to sit down and do nothing. What would be the feeling of the thousands

of doctors in the Services if they came home and found that nothing had been done for them? He hoped they would come home and be unable to recognize their former field of service because it had been improved out of recognition. It was a great mistake to imagine that they at that meeting were going to pass a series of final resolutions and construct a medical service. It was a much more complicated business. There would have to be further reference to the profession, and members in the Services would be consulted.

Asked by a member whether he could give a guarantee that members serving in the Forces would be able to answer the questions sent to them and return them without interference by a superior officer, Mr. Souttar said that he could give no absolute guarantee, but he knew many senior officers, and he would be enormously surprised if, so far from interfering, they did not do everything to assist those under their command in making such returns.

Dr. C. N. BINNEY (Reigate) said that there were two reasons why no settlement should be made with the Government until these Service members came home and had a chance of formulating their opinions. Men on active service could not be expected to give due consideration to a questionnaire sent to them. Another reason was that the men in the Services would be those who would have to bear the brunt of the changes, not the seniors who mainly composed the Representative Body. What right had these seniors to make decisions for them? How would they feel if, having agreed to protect the practices of these absent men, the men came back to find practice conditions so modified as to be unrecognizable?

Dr. RAYMOND GREENE (Buckinghamshire) considered that there was something a little sinister about the way in which those serving in the armed Forces were being used for political propaganda in favour of delaying action. Those who urged delay might find themselves responsible, if they succeeded, for conclusions forced upon the profession. As a member of the staff of a teaching hospital he had talked with a large number of these young men both before they went into the Services and afterwards, and their almost unanimous feeling was one of apprehension at the prospect of coming back after the war to no practice and the likelihood of a long delay before it was possible for them to earn a living. Over 90% of those he had questioned had said that they hoped the doctors left behind would make decent conditions to which they could return.

Dr. BARROW strongly repudiated the suggestion that this was a political stunt. The motion, as he had said, was initiated by Service members themselves. They did not ask that nothing should be done, but only that there should be no fundamental changes. If this motion were rejected they would interpret it as meaning that those left at home had little interest in the future of those in the Services, though that, of course, was not the case.

The motion was lost.

Whole-time Salaried State Service

Dr. J. B. JESSIMAN (Worcester and Bromsgrove) moved:

That the Representative Body is not in favour of a whole-time salaried State Medical Service.

He said that the Government had tried to hypnotize the public into the belief that "the new Beveridge is good for you" and that the medical service to which it had been accustomed, and at which it had no great grumble, was so hopelessly inadequate that it required complete and revolutionary reorganization. The innuendo was false, and the enlightened public wondered whether they might not be pawns in a political game. The action of the Government appeared to be governed by political expediency. In their schemes the Government had an able executive officer in the Minister of Health. He it was who had introduced the new "£420" group without consultation with the profession. On the other hand, the name of the British medical profession stood high. They knew that their service was not perfect, but repeated suggestions for improvement which they had made to the Government had been treated with disdain. They wanted the public to have a comprehensive co-ordinated medical service, but with the minimum of State control, regimentation, or direction. As insurance practitioners they had had experience of State control in medicine. The regional medical officer could and did control not only certification but treatment. Under a whole-time State Medical Service the position would be worse; if such were a salaried service it would be much worse, and if it were an inadequately salaried service it would be unthinkable. At the beginning of National Health Insurance the relative proportion of private and insured patients was probably as 70 to 30, now it was 50 to 50, and in future it was likely to be 10 to 90. The increase in State control was likely to be proportional to the increase in numbers of the insured. In short, practitioners were now considerably controlled by the State and were faced with the likelihood of a large extension of control under existing rules. State interference with the liberty of the individual—patient or doctor—should be at a minimum. Bureaucratic control was invariably accompanied by lack of flexibility and initiative, and by waste of time, personnel, and public money. It therefore failed in the object for which it was supposed to exist. By voting for this motion they would be making it plain that they refused to submit to regimented drudgery, to being made a group of unthinking certificate-signing robots. With a salaried service State control would be complete; the very last vestige of freedom would be gone. He appealed to the meeting to show the Minister of Health in no uncertain way that they were no longer the politically lethargic profession of yesterday, that they refused very definitely to be salaried State lackeys, that they owed more than this to the public and to their own self-esteem. He warned them that the Minister's proposals were in cold storage, or, to use his own term, in the discard, and were more than likely to be served up, re-hashed, of course, and well camouflaged, in the White Paper about to be published.

Dr. W. V. HOWELLS (Swansea) expressed the view that the opposition to control by local authorities was the only point on which the profession was unanimous. Dr. Anderson in his recent excellent address had said that the medical profession had a plan, though not a detailed scheme. But surely this was simply the National Health Insurance

THE MINISTER OF HEALTH ON THE FAMILY DOCTOR

when he said that he hoped his tenure of office would be short. Lord Dawson, in response to the vote of thanks, said that they would by their mutual efforts get through what were undoubtedly difficult situations for the medical profession, the more difficult because they were new and there was no precedent to guide them. Messrs. Price, Watkinson and Co. were reappointed auditors of the Association until the next annual general meeting at a remuneration of 300 guineas. The annual general meeting then concluded.

Referring to the National Health Insurance Association of Welsh Insurance Committees, the Minister of Health (Mr. Ernest Brown) said that his best friends would not pretend that it had no limitations, and it was obvious that the time had come when people were ready for another step forward. Tales were being told of what the Government had made up its mind to do; most of these, he declared, were completely misleading. When the Government's proposals were comprehensive national health service were drawn up they would be published, and the fullest opportunity would be given for discussion by the public, the medical profession, local government, and all concerned. At that stage discussion and criticism could be based for the first time on full knowledge of what the Government had in mind. One of the first things must be to cut down some of the limitations on the service which could be rendered now and see that people could get consultant and specialist advice, hospital and convalescent treatment, and so on. The scheme must aim at prevention as well as cure. In spite of some statements to the contrary, it was the avowed intention of the Government to preserve the principle of free choice of doctor. But this could only mean "free choice of the doctors available." One of the things the new service might do was to secure more doctors in some of the areas—mostly congested—where there were not enough now. In those cases the new service would provide a "freer" choice than hitherto. Bureaucracy was a well-worn word which, he supposed, meant an over-organization. No one would deny that in this complicated world some organization was necessary, but the Government was as anxious as anyone else to see that nothing was done to stifle and inhibit progress in one of the greatest professions.

The new health service must be based on the family as a unit and the general practitioner as its primary attendant. It had been alleged that the Government wanted to abolish the family doctor. In fact, the Government's aim was to provide a family doctor for millions of people for whom none was available at present. The organization of a new health service would make it possible to have a completely integrated medical service, starting from the family doctor and embracing all the hospital services. This would also allow a full complement of specialist service to be available to general practitioners, who would greatly benefit by being able more freely to call in consultants and by closer connexion with the work of hospitals. The Government also hoped to provide for postgraduate courses, but, what was even more important, the practitioner must have the opportunity for leisure to get the best possible advantage from these courses.

newspaper had stated that 90 members abstained from voting, and another that 70 had done so. In fact the number of Representatives entitled to vote was 232 and the number voting was 210. There was no reason to suppose that any Representative deliberately abstained from voting. As always happened, a few were temporarily absent from the meeting for reasons quite unconnected with the question at issue. He was also informed that the B.M.A. in its broadcast the previous evening had stated that the Representative Body had voted against a State Medical Service. That was not the case; what it had voted against was a whole-time salaried service, which was a different thing. There was already in existence a National Health Insurance service which was a State service, a service to which the medical profession had given of its best, and which very many of them desired to see extended. The remarks of the Chairman were received with general applause.

(To be continued)

ANNUAL GENERAL MEETING

The annual general meeting of the Association was held in the Great Hall of B.M.A. House, London, on Sept. 22, the Chairman of Council (Mr. H. S. Souttar) presiding. The notice convening the meeting was read, and the minutes of the last meeting, which had been printed in the Supplement of Sept. 26, 1942, were approved and signed as correct.

The Chairman indicated the new President (Mr. Hon. the Viscount Dawson of Penn) for 1943-4, and invested him with the badge of office. In doing so he said that it was unnecessary for him to speak about the great position which Lord Dawson held, alike in the world of medicine and in the realm of their affections. He was President of the Association in 1932, the centenary year, and it was a great compliment to the Association that he, the doyen of the profession, should have come back again to help them in this critical time.

Lord Dawson, who was received with acclamation, then proceeded to deliver the brief presidential address which is printed at page 49 of the Journal. At the close, Dr. Peter Macdonald, Chairman of the Representative Body, proposed a vote of thanks. He spoke of the gratification with which they had again to accept the office. That gratification was increased by the address which had just been delivered, especially by the understanding reference to the whole-time salaried service—a vote which had been the subject of a whole-time salaried State service—a vote which had been the subject of much discussion in some sections of the Press. The present occasion was unique in that never before had a former President resumed the office after an interval of years. They could not help contrasting the present occasion, with its relatively small though select audience and its absence of pageantry, with the centenary meeting at the Queen's Hall at which Lord Dawson had given his previous presidential address. It was probable that he would be asked to retain the presidency for as long as the war lasted, and he would not misunderstand him

scheme, with its two-way extension, Such an extension, though an important step forward, merely touched the fringe of the problem. All the evils of the competitive system would continue—the sale of practices, the inflation of the value of practices, the hard and constant drive on the practitioner, with insufficient time for attention to each patient, let alone for keeping himself up to date by postgraduate study. The system needed radical alteration. In conjunction with its entirety, the B.M.A. should throw its full weight into the struggle against disease and the causes of disease—bad housing, malnutrition, insecurity. The Association could only take its proper part in the changes which were coming if it had a definite policy for the evolution of a comprehensive full-time salaried service. Last year Swansons had declared for a State salaried service, but it was now realized that the word "State" aroused alarm. What was wanted was a comprehensive medical service with a measure of co-ordinated direction.

Dr. G. H. Steele (Worcester) said that he was prepared to agree that some form of State Medical Service was coming. What they should endeavour to do was to mould it to the best of their ability to their own ideals. After pointing out some disadvantages of a whole-time salaried service, he begged the meeting to support the motion brought forward by his Division.

Dr. W. D. Anderson (Glasgow) considered it would be impracticable to run a whole-time salaried service on the inadequate personnel at present available. Dr. C. M. Stevenson (Cambridge) said that the argument should be as to what was best for the public, not what was best for the doctor. A comprehensive service might be provided which was not a whole-time salaried one, and the public might be better served. He was opposed to a whole-time salaried service; it might be easier for his patient, but it would be less good for his patient.

Mr. J. A. Coker (Belfast) moved as an alternative motion (and this was accepted by the representative of Worcester and Bromsgrove):

That in the opinion of the Representative Body the granting of a whole-time salaried State Medical Service covering the whole population is not in the best interests of the community.

He said that the Belfast Division had passed this by a large majority because it was felt that such a system would be likely to result in a deterioration of the service. Dr. S. Wand suggested the omission of the words "covering the whole population," and this was accepted by the mover. The debate seemed likely to be prolonged, but Dr. R. W. Cockshut (London) said that all the Representatives had probably made up their minds on this question, and it seemed of no use to repeat familiar arguments. Therefore he moved that the question be now put.

This was accepted and the vote was taken by show of hands on the Belfast amendment as follows:

There voted, in favour 200; against 10.

Misleading Press Comment

At the opening of the meeting on the following day the Chairman drew attention to some misinterpretations in the Press regarding this division. One daily

CORRESPONDENCE

OCT. 2, 1943

Correspondence

The "Inevitable" Future
 AR.—It seems that the agreed purpose of the medical profession is to serve the public in return for fair and reasonable conditions of service. Twenty years ago we were convinced that the present arrangement is a very patchwork affair and that vast improvements can be made by the co-ordination of all the various branches of medicine. Co-ordination of a service for the whole community can only be tackled by the Government and the elected administration of the community. This is evidently the opinion of the Government, for they have already promised the House of Commons "a comprehensive medical service." Such a promise is not to be ignored with impunity in any calculations which the profession may make.

The word "comprehensive" is open to various interpretations, but I think it prudent to interpret it in its widest sense. Thus I take it to mean that all branches of medical services are to be organized to serve all persons. It seems to me to be the wildest form of dreaming to imagine that the Government can provide such a service without assuming control of the executive—i.e., the doctors. To bury one's head in the sand and to attempt to refuse to work such a service would be to court disaster and to forgo the opportunity of helping to frame the scheme and its terms of service.

Very shortly, we hope, hostilities will cease, and there will be on the professional labour market about six years of qualified men who have no financial roots in any practice or locality. The Minister of Health would fail in his duty to the public if he did not use these untrained doctors to lever his scheme into effect. Equally, he would be unfair to the doctors if he permitted them to use capital in the purchase of practice which he knows he is about to take away from them with compensation. As I see the position, a State service will be a great stride forward in the social structure of the country, and it is undoubtedly coming, whether we all like it or not. The wisest course, then, is to shew half-measures and to collaborate to the uttermost with the Ministry officials in securing the best possible service, which must largely depend on the conditions under which the doctors do their work. I should like to endorse Mr. Wilfrid Adams's plea for more time in which to examine and study each patient. As he says, the answer to this is more pay per patient and more doctors. This, in turn, means a greater output from the medical schools. This is but one point which we might well spend time in pressing on the Ministry rather than wasting time in putting up a show of resistance to the inevitable.—I am, etc.,
 W. M. CASPER.

Freedom or Control?

SIR.—Every one naturally wishes to preserve for himself as much freedom as he can, but unlimited freedom is clearly impossible and undesirable. For instance, we are denied the freedom of the road. We should be careful not to give the impression that our interest in freedom is confined to preserving our right to sell our medical knowledge to sick people for

a fee, without regard to the right of the public to arrange for doctors who are not dependent on sick people as such for their income, and who will not ask for money from people who are down on their luck through illness.

It would be a pity if Dr. J. O. M. Rees's letter (*Supplement*, Aug. 21, p. 25) were to give the impression that our attitude to a State Medical Service is conditioned only by our anxiety to preserve our own freedom in its entirety, and to see that our services are not secured "at a low rate of remuneration."—I am, etc.,
 L. M. FRANKLIN.

Sidcup, Kent.

"Bargaining" with the State

SIR.—It seems to me that in any bargain with the State there are four fundamental principles involved.

1. In whole-time service it is immaterial whether service is accepted directly under the Crown or indirectly under a corporation responsible to and controlled by the Crown. It is also immaterial whether payment for services rendered is made directly by salaries or indirectly by capitation fees. In either case the State collects the money and pays it out—i.e., controls it. "He who pays the piper calls the tune."

2. It is immaterial what conditions and "safeguards" are inserted in any contract with the State. The State can vary or abrogate them without consulting the other party, and there is no legal redress. "The King can do no wrong" (cf. the recent alteration in the income limit under the N.H.I. Acts).

3. In a democracy there are only two methods of exercising pressure on the State: voting power and the power of a largely independent trade or profession. The former is negligible in our case; there are not enough of us and we are distributed among all political parties. There remains only the latter.

4. For a trade or profession to be powerful enough to exercise pressure on the State there are two essentials: (a) The number of those engaged in whole-time State service must be negligible as compared with the whole body. (b) The income of those engaged in part-time State service must only in small part be derived from the State and in larger part from private sources.—I am, etc.,
 J. A. BALCK-FOOTE.

Andover.

The Doctor and the Public

SIR.—A panel practitioner to-day with private patients added to his list may see anything from 60 to 70 patients in his surgery a day in the summer and in the winter from 80 to 100. His visiting list will be anything from 15 to 20 a day in summer and from 30 to 40 in the winter, and if an epidemic comes may be between 50 and 60. Now suppose he takes on the average five minutes at each case (which starts when the patient leaves his seat in the waiting-room and ends when the doctor abruptly tips him out), we see that in the summer this "tip-and-run" affair takes at least 5 hours and in the winter between 7 and 8 hours. Now if the doctor takes ten minutes for each call, which includes stopping and starting, getting in and out of his car, getting into the house, throwing his hat on one side and rushing upstairs, taking a hasty look at the patient, a prescription, a certificate or two, and maybe a milk form, then finding his hat and a bolt for the door—if he is lucky he just makes it in the time—visiting in the summer

totals about 4 hours and in a normal winter about 7 hours—a grand total of 9 hours a day in summer and from 14 to 15 in the winter. Add all the late calls and the night calls, including maternity cases, and one has a "working day" spent anything but in the way medicine was intended to be pursued by those who taught us. The history-taking, the inspection, the palpation, the auscultation are atrophying from disuse; their place is taken by the clock, the certificates, and everything that makes for the game of "tip and run."

Surely we can by the use of skilful propaganda win the vast number of people of this country to our side so that we can produce a plan for medical services that will be above reproach. Why not try to get their confidence? They are not a Government, can help us to lay before the country a plan that would be for the good of all, and which surely the medical profession alone with the help and understanding of the nation could evolve. We should go out to the country demanding that we be allowed to produce the form of medical service that we know would be best, and which would make us once more doctors and not office clerks.—I am, etc.,
 JAMES G. BELL.

Nottingham.

What Price Prestige?

SIR.—In recent weeks I have been greatly exercised in trying to get medical certificates of unfitness for National Service (fire-watching) accepted by the authorities. After a great deal of correspondence a final letter from the Minister of Home Security in answer to a letter from the local M.P. settles the matter to my disadvantage.

The following are two extracts from this letter which, I think, deserve to be widely known and on which other doctors may care to comment.

1. "It is not possible to accept the position that a doctor's certificate must be accepted without question." From this it would appear that while doctors are called upon to write more and more certificates their value becomes less and less.

2. "... Such persons are, however, entitled to apply to the grounds of medical exemption on the grounds of medical unfitness or of exceptional hardship. These committees are independent tribunals, and they are entitled to subject a statement of fact or opinion in a medical certificate to the same examination and scrutiny as other evidence."

The tribunal, who allowed me to be present at their proceedings, had no medical man among them, and their questioning demanded from me not an answer as to whether the applicant for exemption was fit or unfit but an answer to "What is the matter with your patient?"

Have the B.M.A. accepted on our behalf the principle of a lay committee judging matters of medicine, and, moreover, demanding answers involving, in my view at any rate, the principles of the confidence between patient and doctor? It is true that the new regulations put applications for exemption on medical grounds in the hands of the Regional Commissioner, but this does not alter the fact that the prestige of a medical certificate has fallen to such a low level, nor does it appear to help a doctor to protect his patients, in spite of the knowledge, from such doctor alone can possess, of which being compelled to exertions of which they are physically incapable.—I am, etc.,
 HENRY YATES.

Alton, Hants.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 9 1943

ANNUAL REPRESENTATIVE MEETING (cont.)

First Day, September 21 (cont.)

FUTURE OF MEDICAL SERVICES

Meaning of a "Comprehensive" Service

Dr. E. C. DAWSON (Derby) moved:

That the "comprehensive medical service" is a service devoted to the prevention, diagnosis, and treatment of injury and disease in the individual, the service includes all services in relation to an individual or a group of individuals rendered at the request of a third party.

He thought it necessary to have a clear conception of what exactly was understood by a future medical service. In the "Principles" put forward by the Representative Committee and the Council medical services were referred to in many as half a dozen different ways. The title and a definition seemed to be required. For the title he suggested the two adjectives "comprehensive national" in front of "service." As to content, he believed it was the desire of the meeting that there should be some sort of limitation to the service. His resolution accepted services given at the request of third parties, by whom he meant the Ministry of Labour, the Ministry of Pensions, and local authorities, among others. The time limit prevented Dr. Dawson from completing his argument.)

Mr. H. S. SOUTTAR (Chairman of the Representative Committee and of the Council) could not believe that this resolution meant anything at all. Surely a great deal of the work of the medical profession must necessarily be at the request of third parties.

The motion was lost.

Dr. J. A. PRIDHAM (Dorset) at this stage desired to propose a resolution of appreciation and confidence in the Representative Committee and the Council. He felt that something ought to be said in acknowledgment of the supremely difficult task they had undertaken. He suggested that during the last few years he Council had led the Association extremely well. (Applause.) It was suggested that such a motion would come better at a later stage, and accordingly it was deferred.

Mr. J. A. CORKEY (Belfast) moved that where the word "doctor" occurred in the "Principles" it should be replaced by "registered medical practitioner." "Doctor" might connote some unqualified or auxiliary status. Dr. J. A. BROWN (Birmingham) pointed out how ridiculous his would make some of the references, as, for example, "That there should be provided for every individual the services of a registered medical practitioner instead of 'family doctor'"] of his choice."

The motion was lost.

Reaffirmation of Basic Principles

Prof. R. M. F. PICKEN, on behalf of the Council, moved the first of the fourteen basic principles set out in the Supplementary Report of Council. The first one reaffirmed the principles laid down

in the Association's "General Medical Service for the Nation," approved in 1938—namely:

That the service should be directed to the achievement of positive health and prevention of disease no less than to the relief of sickness; that there should be provided for every individual the services of a general practitioner or family doctor of his choice; that consultants and specialists, laboratory services, and all necessary auxiliary services, with institutional provision when required, should be available; and that the several parts of the complete medical service should be closely co-ordinated and developed by the application of a planned national health policy.

Prof. Picken said that the object of including this was to make it obvious to other persons and to remind themselves that this question of the evolution of medical services had been under consideration by the B.M.A. for many years, and that they were not being driven to produce a document just because Sir William Beveridge had produced a report. Having recalled these principles, laid down in 1938, the meeting would go on to consider and, he hoped, to adopt the further thirteen principles set out.

This was agreed to without dissent.

Dr. T. CRAIG (Newcastle-upon-Tyne) proposed to add at the end after "application of a planned national health policy" the words "acceptable to the profession as a whole." It was not an occasion for argument, but they were all talking of safeguards, and it was as well to add these words. Sir KAYE LE FLEMING considered this a most important principle. If he had been drawing up a set of principles to govern their action this would have been almost the first to be considered. The primary requisite of a comprehensive medical service was that it should receive the willing co-operation of the great majority of the profession.

The addition was agreed to by the meeting, and a further amendment agreed to was the substitution of the word "available" in place of "provided" ["that there should be available for every individual . . ."].

Social and Environmental Conditions

Prof. PICKEN moved the adoption of the second "Principle":

That the health of the people depends primarily upon the social and environmental conditions under which they live and work, upon security against fear and want, upon nutritional standards, upon educational facilities, and upon the facilities for exercise and leisure.

Dr. L. J. PICTON (Crewe) moved an amendment whereby "nutritional standards" came first among the factors mentioned. He said that nutrition was the fundamental protection of the body against disease. To fail to put it first was to place themselves in the wrong. Great as were the achievements of the public health services in the direction of preventive medicine, they were trivial compared with what was possible on a nutritional basis. He quoted the work of McCarrison in India and of McGonigle in Durham. The Ministry of Agriculture was far more important than the Ministry of Health.

Prof. PICKEN hoped that this amendment would not be accepted. He defied anyone to state the relative value of the various factors. Theories as to the physical or social cause of certain diseases were frequently changed.

The amendment was lost, but an amendment by Oxford was accepted whereby there were added at the end of the recommendation the words: "The improvement and extension of measures to satisfy these needs should precede or accompany any future organization of medical services."

Dr. J. A. BROWN (Birmingham) hoped that the meeting would not regard the recommendation as a pious resolution. It would be useful to have the whole weight of medical opinion behind it. It had been said that no medical service could be other than a repair shop for damaged human machines so long as the people lived in a state of economic insecurity, were inadequately fed and badly housed. As a general practitioner he felt strongly that real preventive medicine brought in all these factors. The sooner they turned to the prevention of disease on this large scale and in this positive way the better it would be for the country.

The recommendation with the addition of the words suggested by Oxford was carried.

Conditions Precedent to Efficient Service

Prof. PICKEN moved the third of the "Principles":

That the efficiency of a country's medical services, both preventive and curative, depends upon the available medical and scientific knowledge, upon the character and extent of medical education, and upon the absence of any economic barriers that impede the utilization of such services.

The recommendation went on to call for a great increase of the facilities and resources for medical research, the maintenance at a high standard of medical education, both undergraduate and post-graduate, and the removal of economic barriers which prevented advantage being taken of such services.

Dr. BALFOUR BARROW (Winchester) moved to insert the words "quality of personnel" after "medical education." The service rendered to the public demanded high qualities in the medical student. Prof. PICKEN accepted this amendment subject to some consideration of the drafting. Dr. BARROW then moved a further amendment to delete the reference to economic barriers. This amendment, however, was lost.

Dr. B. R. VICKERS (South Bedfordshire) moved for the insertion of certain words the purpose of which was to open more widely the door to medical education. He said that at present a number of young men and women were precluded from taking up medical education because of its cost, although they would make admirable doctors. The great extension of medical services in the future would call for an enlarged personnel. Some subsidy seemed to be required. Prof. PICKEN was unable to

high doctors rendering personal service and to be controlled by the State. Control was necessary by reason of the necessity for safeguarding communal health and lessening the incidence of disease. In a democratic country the State was the expression of the majority of citizens. Were they, then, in a position to refuse action if the State desired to finance and organize a service?

Dr. C. K. CULLEN (City of London) said that as a tuberculosis officer of a local authority he had never experienced any interference with the doctor-patient relationship nor with his clinical freedom. He desired to see a much greater extension of democracy in the direction of the people with whom one came in contact; these were the people who would protect and defend one, if one's work was good, from the interference of more distant body.

Dr. R. W. COCKSHUT (London) complained that the views of a small minority were too persistently put forward. They had received the most patient hearing imaginable and had been turned down by enormous majorities again and again. The time had come to stop this continuous attempt to make the meeting change its views on this question. Those concerned should now help to form a united front of doctors instead of taking action which could only weaken their case in the eyes of the public. As for the circumstances mentioned by the last speaker, the relationship of a tuberculosis officer with his patients was not at all what they meant by the doctor-patient relationship. They meant the relationship of the practitioner who went up to the patient's bedroom when he was ill, not that of the practitioner who got a man's chest x-rayed or even saw him in a sanatorium.

Dr. J. A. IRELAND (Shropshire) said that an attempt was being made to whittle away the previously expressed opinions of that meeting. His own experience made him strongly disinclined to agree to the handing over of the control of medical services to county councils or insurance committees. Dr. DAIN said that one of the supporters of the City of London amendment had spoken of this control as likely to be better than the present anarchy. He did not suppose that many would agree that there was much anarchy about the way in which medical practice was conducted to-day. Dr. INWALD replied that he and his friends might be speaking for a minority, but it was a considerable minority. In London on a clear-cut issue of a fully comprehensive State salaried service the voting was roughly 400 in favour and 900 against. It was quite a definite section of the profession which urged this point of view. The Representative Body was not representative of the general practitioner vote.

The City amendment was lost by a very large majority.

What the State should Not Do

Dr. O. C. CARTER (Bournemouth) proposed an amendment to delete the first sentence in the Council's recommendation, arguing that this would apply only in a State Medical Service. The meeting had already agreed as to the function of the State as being to co-ordinate existing provisions, both official and unofficial. That being so, it seemed unnecessary now to adopt a negative attitude and to say what the State should not do. Further, the word "control" was exceedingly

vague. It might mean financial, administrative, or professional control, and it was obvious that in any medical service in which the Government had a financial interest there must be some form of control. It was not a happy phrase.

Dr. BALFOUR BARROW (Winchester) also thought the sentence unnecessary. Surely it was the privilege of the medical profession to organize medical services to the public on lines which experience had taught them were in the public's best interests. The first sentence suggested an abrogation of rights and an undoing of the vote taken on the previous day.

Sir KAYE LE FLEMING agreed with the last two speakers. The second sentence in the recommendation was so important that it should not appear to be qualified by the first. As it stood it might be interpreted by an ill-informed member of the public as meaning that the profession was prepared to take anything from the State but was not prepared to submit to control. Dr. W. N. LEAK (Mid-Cheshire) said that the State had control of public health officials and of many others, but the point of this motion was that doctors rendering personal service should not be under State control.

Dr. DAIN hoped that the meeting would not agree to delete the first sentence of the recommendation. If it were deleted it would look as if the meeting approved of the State having control of individual and personal services.

The Bournemouth amendment was lost, but an amendment by Ayrshire was accepted whereby the words "while assuming responsibility for the organization and provision of medical services" were deleted.

Dr. BERTHA TURNER (St. Pancras) moved to insert the words "in their professional capacity" after the words "should not assume control of doctors," but Dr. DAIN was unable to accept this. He wanted the word "control" left in without any attached conditions. They should be equally opposed to control of personal freedom to practise where they liked.

The St. Pancras amendment was also lost.

Limitations of State Control

Dr. R. H. MOLE (Oxford) moved another variation of the first sentence of the recommendation:

That the State, while assuming responsibility for the organization and provision of medical services, should limit its control of doctors rendering individual or personal health services to ensuring the maintenance of a reasonable professional standard and a maximum of personal and professional responsibility.

The Oxford Division had thought it better to put this in a positive way and to say that control should be limited to ensuring the maintenance of a reasonable professional standard. This was already the responsibility of the State through the General Medical Council, which exercised control over, among other things, lax certification. In any service so complex as a comprehensive medical service there must be control in the sense of direction. He also wished to emphasize the word "responsibility," which was singularly absent from the principles put forward in the "General Medical Service for the Nation." Dr. P. PHILLIPS (Bristol) said that in Bristol they felt that the organization of any future medical service should be by the doctors themselves, and they looked to the Association to lead them in the organization of such a service.

Dr. R. FORBES (Hendon) thought the Oxford amendment dangerous in that it suggested that control should be defined and qualified in a particular way. Control over the profession in respect of educational standards and disciplinary measures was exercised by the G.M.C. There was also control by way of the common law. If the proposer of this amendment now suggested that the State itself should go forward to lay down standards which every practitioner should attain, irrespective of his responsibilities, then a serious new element was being introduced which would create great difficulties. Dr. J. G. THWAITES (Brighton) found it difficult to see how any sort of control could increase the personal and professional responsibility of the practitioner. Dr. MOLE replied that there were many things which limited the doctor's freedom of action in professional as well as personal matters, and it was to have their heads in the clouds to use the word "control" without any limitation at all.

The Oxford amendment was lost. An amendment by Darlington and other Divisions opposing the setting up of any central authority, medical or lay, to control the profession was met by a motion to proceed to the next business, which was agreed to.

The recommendation underwent some transposition in the course of the debate and as finally carried read as follows:

It is not in the public interest that the State should convert the medical profession into a salaried branch of central or local government service. The State should not assume control of doctors rendering individual or personal health services. The profession rejects any proposal for the control of the future medical service by local authorities as at present constituted.

Dr. G. H. STEELE (Worcester and Bromsgrove) proposed the addition of the last sentence of the above. He said that members of local authorities as at present constituted were elected for their political views, and it was most undesirable that such views should interfere with the control of the profession. Moreover, in the election of local councils the profession had no voice, except in so far as its members voted as individuals. Local authorities seldom had any conception of the problem set before practitioners in their treatment, and there was ample evidence of the unsympathetic attitude of such authorities in the matter of fees.

This motion was accepted, apparently without dissent.

Free Choice

The next "Principle," moved by Dr. DAIN, was:

That free choice of doctor should be preserved as a basic principle of future health services, and no administrative structure should be approved which does not both permit and encourage such free choice.

Dr. DAIN said that free choice of doctor meant the freedom of the patient to choose or change the doctor and the freedom of the doctor to accept or decline the patient. It was a two-way freedom.

Dr. J. C. ARTHUR (Gateshead) moved to substitute the words "as between doctor and patient" for the words "of doctor." The Government had stated that this was accepted as a basic principle of any medical service. But if it were in any way whittled down it ceased to be free choice.

The amendment was carried.

Dr. G. DE SWIET (Kensington) moved to amend the recommendation so that it would read: "That no administrative structure should be approved which does

putting on the one side official and on the other side unofficial doctors. If a doctor was employed in the service and accepted responsibility for a particular patient, while it was obvious that he could not accept fees from or on behalf of that person, he should be free to be consulted by any other member of the community privately, even though such member was provided for by the service. The recommendation did not refer entirely to private practice; it provided for conditions which would apply to consultants and specialists as well.

Mr. McADAM ECCLES asked whether there was not a possibility that some doctors would be in the service but could not be whole-time salaried practitioners. These might form a third class, to be consulted privately. Dr. DAIN replied that these did not make a fresh class. They were in the service, and, like others, would be able to be consulted by those who were willing to pay fees. He added that he did not regard this proposal as an endowment of private practice, but as affirming the essential freedom of doctors to be consulted and of patients to be treated by whom they saw fit.

A different form of words was moved by Harrow, but Dr. DAIN took exception to it on the ground that it left specialists and consultants out of account, and was constructed purely from the general practitioner point of view, and the amendment was lost. The same fate befell an amendment by Oxford for a variation in wording whereby it was emphasized, according to the mover, that it was the patient who was going to do the choosing; the amendment was designed to forestall any lay misinterpretation.

Dr. ELSIE WARREN (Kensington) moved to delete the first sentence of the recommendation, and this was supported by Dr. LUCAS YOUNG (Eastbourne), who held that the second sentence contradicted the first. A patient with £500 a year and a family would be very pleased to have this medical service, but what if he heard that one of his richer neighbours was availing himself of the opportunity of getting his medical attention privately, and paying for it, although entitled to it as a statutory benefit? He would imagine that this man was paying for some extra attention which he himself was not receiving under the State scheme, and thus the State scheme would be prejudiced. Another patient might say: "I do not see why I should go on paying for this privately when I am entitled to it as a statutory right," and decide to avail himself of this right at an inconvenient juncture in his illness. Some people would say: "There is no need to pay you a particularly high salary under the State scheme because you will have your private practice to fall back upon." Yet private practice might be expected to die a natural death.

Dr. H. SUTHERLAND (Kensington) also asked for the deletion of the first sentence, which properly should appear under the earlier recommendation dealing with free choice. The recommendation as it stood would give rise to misunderstanding. Dr. I. C. ARTHUR (Gateshead) opposed the deletion. The sentence constituted an important part of the charter of the profession. What other profession would be so restricted in the employment of its service? Further, was not the whole-time salaried servant of the State likely to have a

large amount of time which he could devote to private practice? If he were not allowed to do so it would be a waste of medical man-power. Dr. A. C. DE B. HELME (Guildford) said that the meeting had voted in favour of freedom for the doctor, and by rejecting this amendment it would be accepting freedom for the public, which, as an altruistic profession, was what they sought.

Dr. F. GRAY (Wandsworth) said that the freedom of the patient to obtain a second opinion when he wanted it should be a complete freedom. If he could not go to a doctor who was in the service he had two alternatives: to go to a doctor who was not a member of the service (which would be practically impossible for most of the population) or to go to an unqualified practitioner.

Dr. J. A. BROWN (Birmingham) pointed out that the right existed already for the insured person to consult another doctor on the panel. If the Kensington amendment were passed that right would be taken away from the insured person of to-day and the potentially insured also. Dr. R. W. COCKSHUR said that these amendments were the expression of a dilemma. On the one hand, freedom must be preserved; on the other, any "black market" in medicine must be avoided. But freedom up to now had not been abused. Dr. A. BEAUCHAMPEL reminded the meeting of Sir John Anderson's statement during the House of Commons debate on the Beveridge report, that the Government had no intention of forcing the new service on those who preferred to make their private arrangements.

The Kensington amendment was lost. Amendments by Bristol and Torquay to cut out the second sentence of the recommendation were also lost, and the recommendation was carried unamended.

The Question of the 10%

Dr. S. WAND (Birmingham) said that it seemed to him that at this point it was desirable to make a decision on the clear-cut issue of the 90 or 100% of the population who should have medical services provided for them. He accordingly moved:

That it is unnecessary for the State to provide a medical service for that section of the public willing and able to provide it for itself.

Dr. R. L. NEWELL (Manchester) seconded, saying that this was the opinion held by the majority of consultants. Dr. C. F. TURNER (Coventry) said his Division was strongly in favour of 100% service, but if the meeting was in favour of what was now moved it should qualify it by the insertion of the word "personal." Dr. W. P. GRIEVE (East Suffolk) said that this motion was too important to introduce as an "extra." It was not a question for that meeting to decide; it raised vast public issues, and to pronounce an opinion upon it when brought in in this way might easily lead to a wrong decision. Dr. A. S. WIGFIELD (East Hertfordshire) thought that the motion was prejudicial to a recommendation, to come forward later, calling for an extension of National Health Insurance as an interim measure. In his district the vast majority of dependants of insured persons were already able and willing to pay for the services they desired.

Dr. WAND said that after this short debate he felt that it was only fair that the Representative Body should take

more time over such a fundamental motion. He therefore asked leave, which was given, to withdraw it and bring it up under the later recommendation.

Consultants and Specialists

Mr. R. L. NEWELL moved on behalf of the Council:

That consultants and specialists should normally be based on the hospital. For those persons who wish to be treated in private accommodation, whether part of a hospital or not, private consulting practice should continue as at present.

He said that all must agree that to maintain the necessary high standard of consultant service active association with a recognized hospital was essential. The hospital must be regarded as an instrument for the purpose of the consultant's work.

Dr. RAYMOND GREENE (Buckinghamshire) moved to refer back the whole question of consultant and specialist services. The present recommendation was so vague that almost any meaning might be read into it. It meant on ordinary reading that consultant and specialist services must remain exactly as they were at present, being normally based on a hospital. In Buckinghamshire it was not desired that these services should remain *in statu quo*, but that they should form an integral part of a comprehensive medical service scheme.

Mr. NEWELL replied that the Ministry had made no proposals with regard to the consultants and specialists service, but in the meantime he felt that this recommendation should stand. He knew that some consultants had no hospital, and that was regrettable, but he felt that the normal basis of the hospital for the consultants service should be kept in mind, and that consultants should continue to do private practice in the private wing of a hospital.

The proposal to refer back was not carried.

Mr. H. J. MCCURRICH (Brighton) moved to clarify the wording by substituting the words "attached to the hospital" for "based on the hospital," and this was accepted by Mr. Newell and agreed to.

An amendment by Kensington proposed to delete the second sentence of the recommendation. Mr. R. S. BROCK (Denbigh and Flint), in supporting this amendment, said that the inference from the recommendation was that because a patient could afford a small sum, possibly out of his savings, for additional personal comfort in illness, his case was the same as that of a patient who was in a position to spend large sums of money in the payment of private fees. The two issues were entirely different and should not be brought in on one resolution. Dr. H. SUTHERLAND (Kensington) said that his Division was anxious that the door should not seem to be closed upon an arrangement whereby at some future time the services of consultants and specialists would be available in a broader way than now.

Mr. NEWELL resisted the amendment. It happened, he said, in municipal hospitals where there was private accommodation that consultants who were whole-time officers of the hospital had to perform an operation on a private patient and received no fee. That was understandable in some ways, though it was a thing he was very much against; but he was even more against the other method whereby the consultant received no fee, having been chosen by someone who

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 16 1943

ANNUAL REPRESENTATIVE MEETING (concl.)

Second Day, September 22 (concl.)
FUTURE OF MEDICAL SERVICES

Central Administrative Structure

With Dr. PETER MACDONALD in the chair, Prof. R. M. F. PICKEN moved, on behalf of the Council, a recommendation that the central administrative structure set up by the State should be a body concerned only with civilian health services, but should be responsible for all such services administered by the central Government; that the Minister should have a medical advisory committee, and that locally there should be administrative bodies covering wide areas, responsible to the central authority, and representative of the community served and of the local medical profession and voluntary hospitals, with advisory committees representative of the local medical profession.

This recommendation, he said, had been most difficult to frame. The Association had studied the subject since 1929 and had issued statements in 1930 and 1938. It was dealt with also by the Medical Planning Commission, which, before the Beveridge report was issued, set up a special committee to consider this matter alone. In Parliament Sir John Anderson and Mr. Morrison made it clear that the Government had certain ideas on the administration of any comprehensive medical service set up in terms of Assumption B. The Minister of Health in 1941 made a pronouncement about co-ordination of municipal and voluntary hospitals in which he accepted for the purpose of administration the local government machinery. There appeared to be a disposition, if not an intention, in official quarters to revolutionize medical practice but to leave the administrative machine as little changed as possible. He believed that the Association was not prepared to accept that position. Half a dozen or more Government Departments were administering uncoordinated medical services of various kinds, and, so far as he knew, no proposal except from the Association had ever been made to clean up that Augean stable. The Government proposals with regard to local administration seemed to be, so far as they were known, rather small modifications of the existing arrangements, something which could be fitted into the existing framework. The present recommendation was designed to set forth the changes both in central and local administration which would be acceptable to the profession.

There was an amendment from Guildford and Holland to refer back the recommendation on the ground that misinterpretation might arise from the present draft. Dr. A. C. DE B. HELME (Guildford) said that the proposed new central body would be another Government Department in effect if not in name. In the work of such a body the function

of professional representation would be purely advisory, with no authority to enforce regulations; the enforcement would be by laymen in exactly the same manner as obtained in any Government Department to-day. The "sop" of being allowed to elect these advisory doctors would be of little value.

Reference Back Defeated

Dr. G. H. STEELE (Worcester) said that the proposed local administrative bodies would be elective so far as the community was concerned but only nominative so far as the profession was concerned—not a very satisfactory procedure. Dr. A. H. PRICE (Reading) said that his Division did not approve of central control as laid down in the recommendation. "To control" meant "to dominate, manage, or check." The profession would find itself under this procedure bound under the Ministry, with an advisory council of medical men. Dr. W. P. GRIEVE (East Suffolk) said that no mention was made in the recommendation of any right of access of the advisory committees to the Minister or to the local authorities whom they were advising. Dr. C. T. ANDREWS (Cornwall) said that they hoped for control by members of the medical profession who had connexion with active practice rather than by the Ministry of Health either as at present constituted or in a modified form.

Dr. N. E. WATERFIELD (Kingston) objected to the proposal to refer back. The effect would be that no proposals could go before the Minister until the next Annual Representative Meeting. Dr. C. F. TURNER (Coventry) said that this "baby" was undoubtedly troublesome, but surely the doctors in that hall could do more with a troublesome baby than pass it back to its mother. Dr. C. N. BINNEY (Reigate) supported the reference back on the ground that the recommendation contained a dangerous proposal. The advisory committees were not a sufficient check on the powers of central and local authorities. Dr. P. M. BRODIE (Edinburgh) hoped the meeting would not refer the recommendation back. The proposal was necessary as a skeleton on which in their future deliberations they might work. Prof. PICKEN reminded the meeting that the recommendation was part of a document which would have to be issued fairly soon and which the Representative Body would not have the opportunity of considering again. It would be most unfortunate to create a hiatus by the reference back of such a fundamental principle.

The motion to refer back was lost. A motion by Leeds was accepted, making the first sentence of the recommendation run: "That the central administrative structure should be a body concerned only with civilian health services and should be responsible for all civilian health services." Dr. W. S. MACDONALD, in moving this, pointed out that the

medical services of the Government were distributed over many Departments. The State had not shown itself capable of constructive administration in this respect, and there seemed something sinister in the phrase in the recommendation, "administered by central Government." Prof. PICKEN said that they should not throw dust into their eyes. It was inconceivable that any administrative organization could be carried out by any other body than the State. If that was understood he had no objection to the alteration.

Advantages of a Corporate Body

Dr. F. GRAY (Wandsworth) moved an amendment:

"That the word 'corporate' be inserted before 'body' in the first sentence of the recommendation, so as to read: 'The central administrative structure should be a corporate body, etc.'"

There were two possible forms of central administrative structure—a Government Department and a corporate body. A year ago, in considering the report of the Medical Planning Commission, the Representative Body expressed a strong preference for the latter. The matter had now become one of urgency. A Government Department was staffed by civil servants and had its political head in a Minister who was responsible to Parliament for every detail of the Department's work. It was the obvious aim of a Department, with every detail of its work liable to be questioned, to avoid such questions and to make the appearance of things pleasant. Again, the permanent head of the Department was appointed by the Prime Minister on the advice of the Treasury, and the Treasury tended always to recommend a safe man, one who would not bring to the post new ideas or schemes or requests for new money. The officials of the Department, knowing that the Treasury was responsible for these appointments, would not wish in any way to come in conflict with the Treasury. A corporate body consisted of a board appointed as a rule by the Minister for a fixed term of years. They were responsible in general through the Minister to Parliament, but the Minister was not responsible for the details of their work. The board, once appointed, was left to manage the corporation without constant detailed Parliamentary criticism; Parliament had control through the Minister in the appointment of the board, in the annual vote for the Ministry through which the board was responsible, and on occasion through a private motion or on a motion for the adjournment.

A comprehensive, co-ordinated, and unified medical service was wanted. At present medical services were scattered throughout Government Departments, and, knowing the petty departmental jealousies, was it likely that the other Departments would agree to giving up their functions to the Ministry of Health or that the Ministry would embark on a controversy with the other Departments to get them to do so? With a corporate

[illegible]

Voluntary Hospitals in Local Administration

Dr. J. C. ARTHUR (Gateshead) moved to leave out the reference to voluntary hospitals as requiring representation on the local administrative bodies. He felt that the voluntary hospital because of its contributory schemes as at present constituted did not fit into the system of a reconstituted medical service. Contributory schemes gave outside lay bodies to some extent a prescriptive right to have patients admitted and treated at the hospital.

Mr. R. L. NEWELL (Manchester) could not agree with the Gateshead proposal. He did not see how the co-operation of the voluntary hospitals could be secured without giving them such representation. After some further debate the Gateshead amendment was withdrawn.

Dr. J. H. STEPHEN (Aberdeen) moved an amendment designed to define more closely the functions of the central-medical advisory committee, but the meeting bowed to Prof. Pickens's desire not to overload the recommendation with details, and the amendment was defeated.

Extension of National Health Insurance & Extension of National Health Insurance & Extension of National Health Insurance &

possible in order that no one might be individually blamed. Doctors did not like the "usual channels" in which civil representation on the local administrative bodies should be equal as between the community served on the one hand and the local medical profession and voluntary hospitals on the other failed to acceptance, Prof. Pickens saying that, while he hoped for a good representation of the profession, he did not think the principle of equality was one on which they should be prepared to fight to the last ditch. A Preston amendment that the chief executive officer of the local medical advisory committee should be a medical man was also unsuccessful. Better fortune attended a motion by Worcester calling for steps to secure that practitioners acting in association with Government or local government medical services should be eligible for popular election as members of local councils; Prof. Pickens said that this had been a preoccupation of the Council for several years.

As finally carried after various amendments the recommendation of Council concerning administrative structure read as follows:

"The Division was largely in favour of some interim change both practicable and desirable, but at a future date, a revision *in statu quo* into the introduction of a complete medical services, in the main, should remain an amendment."

Dr. G. E. Kilmivan (Derby) moved: "A reconstruction of insurance committee would be necessary."

Dr. B. J. Davis then moved for consideration and completion of the foundation in the recommendation concerning administrative structure, just carried. Assumption B should be satisfied, by an extension of National Health Insurance to include dependants and the life and to cover consultant and specialist services and laboratory and hospital facilities. He added that if Parliament was disposed and anxious to provide for those who were able and willing to provide for themselves, such people might come in as voluntary contributors. A number of fresh interests would be concerned in a reconstruction of insurance committee."

Dr. G. E. Kilmivan (Derby) moved: "A reconstruction of insurance committee would be necessary."

Dr. B. J. Davis then moved for consideration and completion of the foundation in the recommendation concerning administrative structure, just carried. Assumption B should be satisfied, by an extension of National Health Insurance to include dependants and the life and to cover consultant and specialist services and laboratory and hospital facilities. He added that if Parliament was disposed and anxious to provide for those who were able and willing to provide for themselves, such people might come in as voluntary contributors. A number of fresh interests would be concerned in a reconstruction of insurance committee."

been agreed upon and approved it should not fail for want of adequate personnel and facilities. The same question applied to the immediate provision of an enlarged consultant and specialist service; and as for hospital facilities, it was well known that in their present form hospitals had not the out-patient accommodation, the beds, or the medical staff to deal with all the cases which practitioners would like to send for investigation and opinion.

Dr. A. S. WIGFIELD (East Hertfordshire) said that his Division favoured the maintenance of the *status quo*. The interim report of the Medical Planning Commission mentioned three alternatives: a State Medical Service, an extension of National Health Insurance, and "some other method." The third alternative was possibly what the majority of the profession would prefer. He came from an agricultural district where the people appreciated primary values, and he had heard no suggestion in that area that any change in the direction of extension of National Health Insurance was desired.

Dr. H. C. BOYDE (Stratford) supported the amendment. Consideration must be given to doctors who were away in the Forces. Although the most conscientious efforts were made by their colleagues to protect the practices of these absent men it was obvious that in any extension of the insurance services their position would be prejudiced, and the difficulty was not adequately met by the reply that this was only a temporary expedient. Dr. P. KIWALD (City of London) said that the Government wanted Assumption B accepted for the whole population. They ought not to be at war with the Government on this issue. He supported the amendment.

Dr. R. FORBES (Hendon) said that the recommendation had been the declared policy of the Association for many years past. It would be foolish to go back on it and would be misinterpreted by the public. Dr. C. M. STEVENSON supported the Derby amendment. He wanted to see the reorganization of the profession on the lines that the meeting had been discussing, and it seemed to him that the interim proposal now put forward on behalf of the Council might torpedo such reorganization. Dr. L. J. PICTON (Crewe) also favoured the amendment. His Division approved the general idea of a two-way extension, which was the old B.M.A. policy, but felt that the policy should be postponed until other changes had been made.

The hour of adjournment having arrived, the discussion was postponed until the following day.

Third Day, September 23 OTHER ASSOCIATION BUSINESS

By previous arrangement, when the meeting resumed on its third and last day the ordinary business arising on the Annual Report of Council, which it had not been possible to complete on the first day, was taken. A short debate took place on a proposal by Bradford to ask the Council to formulate a method of electing the General Practice Committee on a geographical basis in order to arouse more local interest in its proceedings. The proposal was carried by 59 votes to 56.

"British Medical Journal"

Dr. J. C. MATTHEWS presented the portion of the Annual Report under this

heading. Dr. J. A. L. VAUGHAN-JONES (Leeds) moved to request the Council to increase materially the size of the *Supplement*, owing to the vital importance of current and impending events in medical politics. He said that the comparative absence of information of what the Council and its committees were doing made many members, quite unjustly, critical of the central organization. He thought that during the next six months the *Supplement* should have 25% of the total space of the *Journal*. Dr. E. C. DAWSON (Derby) supported this request. Many members, he said, were ignorant of what was being done in their interests, and therefore a spirit of defeatism developed. Dr. H. VICKERS (Harrow) also urged that much more space be devoted to articles and letters on medical planning and public relations than had been available in the past. Dr. W. W. FOX (London) suggested articles on the medical services in other countries. Dr. A. H. PRICE (Reading) complained of secrecy in the discussions of the Council on the subject of the future of medical services.

Dr. MATTHEWS said that the Journal Committee realized the importance of the *Journal* as the organ of the profession during this critical period, but it kept in mind quality as well as quantity, and a well-written leading article was of more value in attracting attention and informing the public than a much greater amount of ordinary matter published in the *Supplement*. He also reminded the representatives of the difficulties occasioned by paper restriction.

The CHAIRMAN OF COUNCIL pointed out that a great deal of the committee discussions was of a kind which it would be inexpedient to publish because it concerned negotiations which were still proceeding with Government Departments or other bodies. But the Council greatly desired that everyone should be as fully acquainted as possible with what was going on at headquarters.

Sir KAYE LE FLEMING said that the Association was extremely fortunate in its finely produced journal. He knew something of the difficulties behind the scenes. He knew that the Council would do its utmost to meet criticisms and requests, but it should not be forgotten how extremely well served the Association was by the Editor and his staff. (Applause.)

The amendments on this question of *Journal* space were referred to Council, as was a further motion relating to advertisements of appointments.

The National Eye Service

Dr. BALFOUR BARROW, on behalf of the Council, introduced the report under that heading and moved its approval. The Committee was at present engaged in the planning of a post-war National Eye Service. Dr. R. LANG (Guildford) moved an amendment that the scale of fees for National Eye Service patients—a scale which had been agreed to but was later cancelled; namely, half a guinea for insured and non-insured with a family income of £250 or less, and one guinea for insured persons up to £420—be put in force at an early date. Dr. LUCAS YOUNG (Eastbourne) said that as there was shortly to be a meeting of the committee the most politic thing to do would be to refer this back for further consideration. Dr. BICKERTON said the Ophthalmic Group Committee had hesitated to enforce the guinea fee because

at that time an announcement was expected from the Minister of Health, but he doubted whether the committee would have agreed to see patients in the higher income groups had it known that the Minister was only going to announce that he had put his plan into the discard. Dr. STEVENSON (Cambridge) asked the meeting to refer this amendment to the Council with a view to its further consideration by the committee. The proposal had been debated *ad nauseam*. Dr. D. F. WHITAKER (Guildford) said that the fees were being dictated by the approved societies. Dr. BALFOUR BARROW said that the whole position of the post-war National Eye Service was *sub judice* and he asked the meeting to reject the amendment.

The amendment was referred to Council.

Hospital Staff Committees

Mr. R. L. NEWELL presented the portion of the Annual Report under "Hospitals."

The only matter which arose was a motion by Mr. HUGH CARSON (Birmingham) to the effect that in all hospitals there should be medical committees composed of the medical staffs above a certain grade, and that where there was a medical superintendent he should be a member of the medical committee and that the decisions of the committee should be communicated to the governing body through him in the first instance. Dr. R. G. COOKE (Derby) said that the Medical Superintendents' Society was in favour of this proposal. Mr. H. J. MCCURRICH (Brighton) said that if the decisions were communicated by anyone at all he would have the liberty to comment on them, and this would be an obvious disadvantage in the case of a medical superintendent who was obstructive. Mr. NEWELL said that the Hospitals Committee was fully in accord with the proposal except for the requirement that decisions should be communicated by the medical superintendent. But he was prepared to accept it if the word "minutes" was used instead of "decisions."

With this modification the Birmingham amendment was agreed to by 74 votes to 63. On the motion of Mr. A. M. A. MOORE (Marylebone) the meeting expressed the view that there should be representation of the medical staffs on the committee of management of all voluntary hospitals. A number of hospitals, he said, including some of the larger ones, had no such direct representation of staffs.

The reports under "Scotland," presented by Dr. G. MACFARLANE under "Medical Ethics," presented by Dr. N. E. WATERFIELD, and under "Science," presented by Mr. ZACHARY COPE, were approved without debate. Under "Medical Benevolence" Dr. J. W. BONE gave some account of the Medical War Relief Fund. Three reports, he said, had already appeared in the *Journal*, and a fourth report would shortly be presented. The amount collected during this period was £50,874, of which £16,600 had been expended. Most of the money had been invested in readily realizable securities, and every penny of it would be needed. This was a joint fund as between the Association and the Royal Medical Benevolent Fund, an arrangement which worked admirably. He appealed for a continuance and acceleration of subscriptions, and for money to buy medical books for prisoners of war.

Interim Policy

The eight members of Council elected for the coming year were: Dr. J. C.

Jones, Fred. W. M., Dr. S. Wand, Dr. W. E.
 Slaveley Gough, Dr. S. Wand, Dr. W. E.
 Thomas, Mr. A. M. A. Moore, Dr. F.
 Gray, Dr. O. C. Carter, Mr. H. J.
 McCuttrich, Dr. J. Hunter, Dr. W. D.
 Frew, Dr. J. M. Hunter.

The following resolution was proposed by Dr. A. T. ROGERS, seconded by Dr. H. GUY DAIN, and carried unanimously:

It was stated that this resolution would be sent to the British Government and to the American, Soviet, and Chinese Embassies for transmission to the appropriate commanders.

members were in countries occupied by the enemy—in Burma, Hong Kong, Federated Malay States, Sarawak and North Borneo, and some islands of the Pacific. There were also the prisoners of war in Germany. He proposed the by whatever methods were possible.

should read as follows:

That a comprehensive medical service should be available for all who need it, but it is unnecessary for the State to provide it for those who are willing and able to provide it for themselves.

Dr. Gregg thought they might be

The amended wording suggested by Mr. Newell was carried by 149 votes to 37. Dr. I. B. MILLER moved, Dr. W.

Dr. R. A. C. MacNAIR (North Bedfordshire) moved that the contemplated extension of the National Health Insurance

It was agreed to proceed to the new business. Dr. W. N. Leak (Mid-Cheshire) moved that persons with an income above existing limits should be encouraged to make provision by joining mutual insurance schemes. Dr. Davis

The Approved Societies

(Shropshire) said that any insurance committee was liable to be outvoted by approved societies' representatives. Dr. Dain here again thought it would be unfortunate to insert such a recommendation. Approved

to the next business. The next business was the recommendation as it had been reshaped by the acceptance of various amendments. As finally agreed it read as follows:

service should be improved from within. Those recommended by the profession. If Parliament decides to make the service available to every member of the community, he permitted to become a voluntary contributor to the extended service. A necessary.

between the Government and the profession, organized experiments in group practice, including health centres of different kinds. He said that an expert mental attitude to this problem would be acceptable to the profession as long as there was very little cost.

methods of practice, including health centres or hospitals, and general practitioner

units attached to general hospitals." This would provide for the working out of an intraprofessional relationship, and furnish beds for research and study into problems of disease as these in their early manifestations came before general practitioners. Prof. PICKEN said that the Oxford amendment seemed to suggest that general practitioners attached to hospital units would be different from those attached to health centres. The wording should be "health centres of different kinds which should extend to general practitioner hospital units attached to general hospitals," or some such words. Dr. ARNOTT accepted this alteration, and in that form the Oxford amendment was carried.

Dr. HOWIE WOOD wanted a warmer phrasing: "That the meeting welcomes the principle of health centres and group practice and is prepared to collaborate," but he failed to secure acceptance of the words. Dr. A. S. WILSON (Holland) desired to see the word "profession" in the recommendation qualified by the words "local medical"; otherwise there was a danger of an area having such experiments foisted on it by some higher authority. Prof. PICKEN said that it was inconceivable that any experiment of this kind should be carried through without the approval of local practitioners. The Association through its central machinery would wish only to help and collaborate with the local profession.

Dr. R. W. COCKSHUT moved: "That experiments in group practice should be carried out by a central authority, and not by local authorities." It was easy to see that a local authority might be in a hurry to set up health centres. Dr. A. BEAUCHAMP said that this would be in conflict with the motion agreed to last year, that groups should not be formed arbitrarily by any outside body. Prof. PICKEN thought this amendment far too narrow. It ruled out experiments in which the initiative came from the local profession.

The amendment was not carried. An amendment by Bolton, that the Government should be responsible for all the expenses entailed in setting up trial health centres, failed on the ground of what Prof. Picken called its too restrictive character, by which it would preclude some voluntary body from undertaking the experiment.

The amended recommendation read (subject to verbal adjustment):

That there should be initiated, by arrangement and agreement between the Government and the profession, organized experiments in methods of practice, such as group practice, including health centres of different kinds, which should extend to general practitioner hospital units attached to general hospitals. Future developments in group practice should depend upon the results of such clinical and administrative experimentation.

This was agreed to.

Future Procedure and Negotiation

Mr. H. S. SOUTTAR made a statement on future procedure. The White Paper would be considered by the committees of the Council and by the Council itself, which would report to the Divisions in preparation for a Special Representative Meeting. There would be no negotiations with the Government until this meeting had been held. On the publication of the White Paper there would be drawn up a questionnaire, with an analysis in relation to the principles approved by the Representative Body, and this would be sent to every member of the profession serving with the Forces, and to every doctor in this country, whether a member

of the Association or not. Meetings would be arranged by Divisions for members and non-members. The results of the inquiry would be made available to the Council, the Divisions, and the Special Representative Meeting. The plan for the Negotiating Committee, the details of which would be recommended to the Special Representative Meeting, would be in outline: (1) that the size of the committee should be agreed with the bodies at present represented on the Representative Committee; (2) that of the Association's representatives, one-half should be nominated by the Council to the Special Representative Meeting for its approval, and one-half directly elected by that meeting itself; (3) that until the Special Representative Meeting the Representative Committee should continue in being for any discussions that may be necessary, but without power to negotiate.

In reply to a question, he said that it was quite impossible for sixty people to carry on intimate discussions in the hope of arriving at useful conclusions. In the Representative Committee a small body had been chosen to pave the way and thresh out certain problems. That small body kept in the most intimate contact with its parent and took no decisions on its own responsibility.

Dr. W. E. DORNAN (Sheffield) spoke of the dissatisfaction with the composition of the Representative Committee which had been expressed at an earlier stage. The discussions were now concluded, and he believed that the majority of the profession were really surprised at the stand taken. Nevertheless, he was disquieted by the absence of any mention of proportion of representation in the Chairman of Council's statement. Dr. HELME (Guildford) complained of the proposal that half the body should be nominated by Council. He asked the meeting to beware of these tactics of nomination. It was essential that the committee to be elected should be an absolutely democratic body.

After further debate on the composition of the proposed committee, Dr. COCKSHUT said that if, as some speakers desired, names had to be sent in from all parts of the country there might easily result a committee which was not representative in any sense of the term. He himself had been critical of the Council in the past, but now he felt strongly that it comprised a body of men worthy of the trust of the whole membership and that nominations by the Council were far more likely to secure a strong and representative committee than names sent in from the periphery. Dr. A. W. WESTON (Dudley) urged that the more democratic way was by nomination from the Branches.

Mr. SOUTTAR said that he saw no reason why, if the Representative Body so desired, it should not act on a motion by Yorkshire, which called for names to be sent from each Branch to the Representative Body, which would make the final selection. But he admitted that he did not see the object of these complex methods of arriving at the nominations. After all, the meeting had been debating for three days the proposals put forward by the Representative Committee, which was set up by the Council, and had accepted them all with only slight amendments. A pretty good testimonial to the work carried on by that committee! (Applause.) As for the proportion of general practitioners, he thought they

could be quite sure, however the committee was elected, that there would be a majority of such. So far as he had any influence or control he would be happy to see that that was so. But the Representative Committee was not purely a committee of the B.M.A. It included representatives of other bodies covering different branches of the profession, and he thought it was a very great thing to have got together a committee like this which was accepted by the Government as representing the whole of the profession, and that the Association should have had so large a share in its appointment and organization. He did not think that the Special Representative Meeting could be called before about next March, so that if the White Paper appeared in November there would be ample time to communicate to members in the Forces, of whose interest he was vividly aware after meeting many of them during his recent journey to India.

The Yorkshire proposal that nominations from the Branches should be sent to the Representative Body, which would make the final selection, was lost, and, with two or three dissentients, the meeting gave approval to the statement of the Chairman of Council.

The Value of Practices

Dr. H. B. MUIR (Fife) moved as a reference to Council that consideration should be given to the changing value of practices in view of possible future legislation, and in particular in view of the position of practitioners returning from the Services. He said that doctors who had remained in civil practice must feel a special responsibility in this respect, holding the position in trust as they did for their Service colleagues. Another factor which was changing the value of practices was, of course, the movement of population.

The motion was agreed to as a reference to Council.

Question of Legal Assistance

Dr. P. A. MCCALLUM (Torquay) urged that in future negotiations with the Ministry the Association should be represented at every meeting by experienced counsel, so that the best possible legal advice was available when negotiations were being carried on which might change the whole shape of medical practice. Dr. J. A. PRIDHAM (Dorset) supported.

The CHAIRMAN OF COUNCIL said that the Association had its own highly skilled solicitor, to whom reference was frequently made. But the proposal to have counsel at all their discussions showed lack of appreciation of the spirit in which these discussions were carried on. Nothing whatever would be gained, and a great deal would be lost.

Dr. W. E. DORNAN (Sheffield) held that if counsel had been instructed the outcome of the Court of Inquiry on the insurance capitation fee might have been different. Counsel would have been able to deal suitably with some of the evidence which the Ministry of Health tendered on that occasion.

Dr. DAN said that the Council, which must be given credit for a certain amount of sense and responsibility, had power to obtain legal advice whenever it seemed useful and necessary. It was possible that at the Court of Inquiry they would have done better with counsel, but if the Association had instructed counsel the Ministry would have done the same.

Dr. McCallum put his request in the form of a motion, which was lost, but a motion by Dr. J. A. Ireland was agreed to, that the Association should avail itself of the services of learned counsel with medico-political experience, though it was not asked that he should be present at every meeting. He said that to refrain from safeguarding their position by legal training and experience was like going into battle lacking some essential armour. Mr. Souttar said that not only would the Council accept this motion, but it was his common practice. If it employed counsel it employed the best obtainable and could afford to do so. A motion by Gateshead, that the medical officer of health of any area should not act as the general executive officer of the administrative body in that area, was also agreed to as a reference to Council.

Reporting Back

Dr. J. HALLAM (North Staffordshire) asked for an expression of opinion that the Negotiating Committee should make it quite clear to the Minister that it reserved the right to make a full report of all proceedings to the Representative Body. The report of the discussions published by the committee now in existence made no reference at all to the Minister's views, and it came as a shock to his Division when it learned in another way what the Minister's views were.

The CHAIRMAN OF COUNCIL said that a certain amount of discretion must be left to the negotiating body. When negotiations were being carried on it was impossible to state publicly all that was in the negotiating body. When negotiations had expressed an opinion, which it had done at that meeting, it was hardly to be expected that the public could be informed of it.

Among several motions which were referred to Council for consideration was one by West Sussex, that each member of the profession should be asked to sign a legal document that he would refuse to take part in any future service the terms and nature of which were not acceptable to 75% of the profession, the bond not to be binding unless signed by 90%.

Dr. J. A. PRIDHAM (Dorset) called for a vote of confidence

Mr. Souttar, as chairman for the moment of both the bodies named, thanked the meeting and said that the Council could not carry on its work unless it felt that it had the Representative Body and the whole Association absolutely and whole-heartedly behind it. In concluding the proceedings some further motions were referred to Council, including one requesting the Council to take steps, by the formation of a group of other means, to watch the interests of the part-time consultant and specialist. Mr. Souttar said that the Council would receive this motion with the greatest possible sympathy.

This exhausted all the motions on the agenda. The Representative Body had sat, on each of the three days, for an average of eight hours, with brief adjournments. Dr. W. Jope, who described himself as a "cantankerous Scotswoman," proposed a vote of thanks to Dr. Peter Macdonald for his conduct of the chair.

He had carried through, he said, a most difficult and intricate job in a most just and impartial manner.

"Beveridge Entire"

Dr. E. M. DEARNS (East Yorkshire) had a motion strongly depreciating the action of the Government in considering As-nomination B whilst not at the same time tacking the social security plan of Sir William Beveridge as a whole. Dr. Dearn asked whether the mover was in possession of information that the Government had not accepted the whole plan. Dr. Dearn replied that the Government had stated as much; otherwise why was Sir William Beveridge trying to get public opinion to support his plan?

It was agreed to pass to the next business, which was another motion by Dr.

tion. Dr. R. A. C. MACNAIR (North Bedford-

at that stage be liable to misinterpretation.

Dr. R. A. C. MACNAIR (North Bedford-

make entirely public because they would

transpiring. Things were said in perfect

good faith which it was undesirable to

possible to state publicly all that was im-

to the negotiating body. When negotia-

things in action. But until the Associa-

tion had expressed an opinion, which it

had done at that meeting, it was hardly

to be expected that the public could be

informed of it.

Among several motions which were

referred to Council for consideration was

one by West Sussex, that each member

of the profession should be asked to sign

a legal document that he would refuse

to take part in any future service the

terms and nature of which were not

acceptable to 75% of the profession, the

bond not to be binding unless signed by

90%.

Dr. J. A. PRIDHAM (Dorset) called for

a vote of appreciation of and confidence

in the Council and the Representative

Committee; this was seconded by Dr.

R. W. MCCONNER (Buckinghamshire),

and carried unanimously and with ap-

plause.

Mr. Souttar, as chairman for the

moment of both the bodies named,

thanked the meeting and said that the

Council could not carry on its work

unless it felt that it had the Representa-

tive Body and the whole Association

absolutely and whole-heartedly behind it.

In concluding the proceedings some

further motions were referred to Council,

including one requesting the Council to

take steps, by the formation of a group

of other means, to watch the interests of

the part-time consultant and specialist.

Mr. Souttar said that the Council would

receive this motion with the greatest

possible sympathy.

This exhausted all the motions on the

agenda. The Representative Body had

sat, on each of the three days, for an

average of eight hours, with brief ad-

jourments. Dr. W. Jope, who described

himself as a "cantankerous Scotswoman,"

proposed a vote of thanks to Dr. Peter

Macdonald for his conduct of the chair.

He had carried through, he said, a most

difficult and intricate job in a most just

and impartial manner.

It was agreed to pass to the next busi-

ness, which was another motion by Dr.

as far as I can gather unanimously.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 23 1943

INSURANCE ACTS COMMITTEE

THE CAPITATION FEE POSITION

A meeting of the Insurance Acts Committee was held at B.M.A. House on Sept. 17, Dr. E. A. GREGG presiding. It was intimated that Dr. R. G. McGowan of Manchester was retiring from the Committee after many years of service. The Committee expressed its regret and its appreciation of his work during his long membership of the Committee.

A report was made on the present state of affairs with regard to the claim for a wartime increase in the capitation fee. The Minister of Health had been told that the Committee did not accept his reply on this question. In the course of discussion some members stated that their Groups were in favour of asking for arbitration and of calling for the handing in of resignations should the request be refused. Some Lancashire representatives complained of the inaction of the Committee. Following a statement made by Dr. Gregg at the Special Panel Conference in March last, in which he had promised resolute action, saying that if there was substantial support from Panel Committees the matter would be pressed to the point of requesting resignations, the Lancashire Committee had withdrawn its own resolution from the Conference agenda, but now, seeing that nothing had been done to implement that avowal, it had passed a resolution expressing a lack of confidence in the Insurance Acts Committee.

The CHAIRMAN said that allowance must be made for the indignation created by the Minister's refusal, but it was unfortunate that such heat should be misdirected; no good purpose was served by attacking one another. He did not withdraw a word of the statement he had made to the Special Panel Conference. During the months before the Conference a committee had been considering the question of reorganization and had reviewed the arrangements to be adopted in the event of a refusal of service. They had agreed that an approach would have to be made to all Panel Committees on the subject in order that the success of the scheme might be fully ensured, and it was with this in his mind that he had spoken at the Conference. He hoped that such a communication would go out; it had been deferred owing to the resolution passed at the last meeting of the Committee, with which he personally was not in agreement, to postpone the matter until the present meeting. Another question had since arisen concerning the payment of war bonuses to civil servants receiving salaries up to £350 a year. This had been made the occasion for a new request to the Ministry to consider the comparable claims of insurance practitioners, and the request had been followed up by an interview at the Ministry in which he and others had taken part. To this so far no answer had been received. Those who had voted for postponement were just as

much as others in favour of resolute action, but it was felt that while they were engaged in certain negotiations it was better to await the result of them.

After some discussion the draft of a letter to go out to Panel Committees was approved. The letter mentioned two major considerations which had led the Committee to postpone the request of Panel Committees to raise the question of resignation in an active form; one of these was the larger issue, now so prominent, of a comprehensive medical service, and the other was the raising of the question of the civil service bonus. The letter concluded:

The position has altered since the last Conference, but the Committee, though as resolute as ever on the capitation question, is seeking to discharge its responsibility to insurance practitioners in a statesmanlike way. Insurance practitioners, like other practitioners, are likely soon to be involved in major questions which go to the root of medical practice. Above all, we do not wish to prejudice the larger issue by action which, though justifiable in itself, might appear to those who wish to see the abandonment of the capitation method a first-class opportunity to introduce an entirely different method of contract and remuneration.

A report was made to the Trustees on the proposed £1,000,000 Defence Trust Fund. Some sixty Panel Committees were mentioned which had up to now indicated their support of the proposal. The Fund stood on August 31 at £286,000.

A Comprehensive Medical Service

The recommendations of the Council on the proposals for a comprehensive medical service, as set out in the Supplementary Report (*Supplement*, August 7, p. 19), were placed before the Committee, which also considered a resolution of the last Conference, that the Council of the Association be asked, in the event of negotiations failing to secure conditions satisfactory to the profession, to have a plan ready to carry on treatment of the sick without participation in the Government plan. It was referred to the executive to explore the possibilities of this.

The Committee further considered a proposal from the Isle of Wight Panel Committee calling for a statement of what the profession itself agreed to be essential factors in an insurance service for the whole community, including the amount of capitation fee and pension considered by the profession to be adequate. In reply it was pointed out that the Representative Committee had declined to discuss the remuneration part of the Ministry's proposals before the form and content of service were settled. No capitation fee or system of payment would be taken up by any negotiating committee before it had been considered by the full Representative Meeting.

Organization of Insurance Practitioners

Suggestions were considered from the London Panel Committee and from one of the Group standing committees for a method of individual approach by means of letter to insurance practitioners, giving

them information and guidance, over and above what appeared in the *Supplement*, though it was appreciated, at all events by the London Committee, that there might be difficulty owing to restriction of paper supplies. The Chairman gave an assurance that sympathetic consideration would be given to such a request.

The question of the groups into which Panel Committees are divided for the election of direct representatives was considered on two requests, one from the Middlesbrough Panel Committee to transfer from the Yorkshire to the Northumberland and Durham region, and the other from the Bristol, Gloucester, and Somerset Committees to form a separate group; at present Gloucester is included with Oxfordshire and Berkshire, and Somerset with Devonshire and Cornwall. It was pointed out that the groups in England and Wales had been arranged with a view to securing approximately the same number of practitioners in each—namely, about 1,100; but that if uniformity of numbers was not insisted on, then it would be easy to arrange the groups on a more convenient geographical basis so as to facilitate communication and meetings. The matter was referred to the executive committee for detailed consideration.

BRITISH MEDICAL ASSOCIATION PROCEEDINGS OF COUNCIL

A meeting of the Council of the Association was held, before the opening of the Annual Representative Meeting, on Sept. 21. Mr. H. S. Souttar presided. Appropriate reference was made from the chair to the death of the former President, Sir Beckwith Whitehouse, which took place with tragic suddenness after the close of the previous Council meeting. The members stood in a silent tribute to the President's memory.

The Chairman said that Lord Dawson of Penn had been approached and had intimated his willingness, if elected, to serve as President. The Council unanimously agreed to recommend the election of Lord Dawson to this position. The Chairman said that it was a great favour which Lord Dawson was doing them. He had many calls upon his time and energy, but it would be a great advantage to the Association to have him in the presidency at this critical time.

Discussion took place on the statement to be made to the Representative Meeting with regard to the setting up of the Negotiating Committee to succeed the present Representative Committee, after the promised White Paper had been published. The Council agreed that the size of the Negotiating Committee should be a matter for the concurrence of the bodies at present represented on the Representative Committee; that one-half of the Association's representatives should be nominated by the Council to a future special meeting of the Representative Body for its approval, and one-half

Council meetings as the Chairman of the Central Medical War Committee the Council nominates members, the actual appointment being by the Ministry of Health. Apart from one or two alterations in personnel, the committee was re-nominated as before, as were the similar committees for Scotland and Northern Ireland.

Salaried Whole-time Service

of the country, and in the Civil Service. I think the service should be contributed to by all citizens, and all should be free to take advantage of it. Should any person wish to make private arrangements for his medical treatment, he could consult any doctor who elected to remain out of the service. Such doctors should, of course, receive compensation for any loss of income caused by creation of the service.—I am, etc.,
C. GODFREY,
Liverpool.

[illegible]

they do not need the spur of economic incentives to provide care. They hear of periodic examinations of all patients, which is a bad example of general experience. They know the need for immediate treatment of the disease, which is extended to the demand for a system of care that is not only effective but also economical. They do not need the spur of economic incentives to provide care.

the adoption of subterfuge, which does not benefit the patients' health, only the doctor's pocket. Surely only in a strained service can the ideal relationship between doctor and patient exist, because there is then no economic barrier between them.

Other objections put forward by opponents of a State service are based on the fear that they will lose (a) money and (b) freedom. An undependable service (as is the present one) would indeed be a tragedy, but this need not be if at the right time we all insist on what we want.

Sir,—I am more than delighted to read that the British Medical Association has decided by a very large majority that the independence of our profession should not be so abused as to make us mere slaves of the State in the *post-bello* world.—I am, etc.,
FREDERICK W. ROQUES,
Middlesex Hospital, W.I.

SIR.—We in the Forces feel rather out of things now that discussions on the future of our medical services are taking place all over the country, and frequently wish we could attend B.M.A. Branch meetings. It appears to me, a temporary onlooker, that the B.M.A. has through-ought Government.

[illegible]

that a number of people have said that their best chance for health lies in the creation of a comprehensive State-salaried service. They cannot see why if this can be done for education it cannot be done for health by doctors to the main objection raised by doctors to this is that in such a service the doctor-patient relationship would automatically be destroyed. That this is a wrong diagnosis is a wrong

the doctor and patient exist, because service can be the ideal relationship be-
doctor's pocket. Surely only in a strained
not benefit the patient's health, only the
the adoption of substitute, which does
"competition causes
"well-being," another for them. This
out of their patients and therefore com-
for as every man to make their living
seems unbusiness-
to me to be

Other objections put forward by opponents of a State service are based on the fear that they will lose (a) money and (b) freedom. An underpaid clerk (as is the present case) would indeed be a tragedy, but this need not be if at the right time we all insist on what we want.

the fear of loss of freedom is equally understandable but again needless. All advocates of a salaried service insist that the doctor must have complete freedom in his treatment of individual patients, and again he has not under N.H.I., and at both patient and doctor must have a right to change when they find themselves unsuited. There is no reason why it should not be accomplished within the framework of the general scheme.

Regarding personal freedom, many of my colleagues in the Army have complained of the endless slavery of general practice, and some even have resolved never to return to it after having found that it feels like to be released from the ranny of the telephone. No doctor will ever refuse to see a seriously ill patient, but under a State scheme some system of regular hours could be worked out enabling each doctor to obtain the leisure to which, it is hoped, every human is a right. A doctor who is not so overburdened with work each day that he has time for regular study and research will surely be the better for it, and so will his patients.—I am, etc.,

P. H. NASH,
Captain, R.A.M.C.

London, W.8.

from the capitation fee end much might be achieved. But such negotiations should mean not a squalid haggle over a paltry sixpence but an attempt to secure a really adequate capitation fee commensurate with the services which should be required. This fee should be at least three times the amount at present allocated. If a fee of two or three guineas were obtainable for medical benefit it might then be possible to include the additional benefit of full specialist services. The profession might also then willingly take over the care of the dependants on a similar basis.

To ensure that adequate provision should become available for industrial and other areas lacking amenities it might be possible to "load" capitation fees for such areas—e.g., by the introduction of three scales: (a) areas with best amenities, lowest capitation fees; (b) areas with least amenities, highest capitation fees; (c) areas of medium attraction, modified capitation fees. In effect the areas with most attractions for prospective practitioners would subsidize service in the less attractive areas.—I am, etc.,

Winchester.

C. J. PENNY.

unable to make full use of it; an increase in the number of doctors' would not solve the problem.

Nurses are trained in the care of patients under medical supervision in hospital, and are fitted to do the same work in domiciliary practice. Training of nurses is shorter than medical training, and large numbers of nurses in the Services and Civil Nursing Reserve will be available after the war. No one with experience of hospitals can doubt that nurses are suited for such work. Can any of us forget the tremendous debt we owe to the ward sisters from whom, as students and house officers, we learnt much about the care of patients? Will this seemingly obvious need be overlooked? Surely not because we are afraid of encroachment by the nursing profession. The general practitioner will still be responsible for his patients, and to the extent to which he can delegate responsibility will depend on the ability of his nurses and on mutual co-operation. The proper use of nurses in domiciliary practice will greatly increase the scope and interest of their work, and will give general practitioners far greater opportunity for making use of their training and developing their faculties. Above all, it will benefit the people whom we serve. Can such service be given except through a properly organized national health service?—I am, etc.,

Redditch.

C. L. POTTS.

Profession and Parliament

SIR.—The Secretary of the B.M.A. in its published address "Evolution, not Revolution" advises the medical profession that if Parliament decides on a 100% scheme, Parliament being the mouthpiece of the people, the profession should accept its decision. Parliament may decide that a full-time salaried medical service is in the best interests of the community. The Representative Body of the B.M.A., on the other hand, has decided that such a service is not in the best interests of the community. Surely, if the majority of the profession agrees with the decision of the Representative Body, it will back up its own convictions by every means at its disposal, whether Parliament agrees or not.—I am, etc.,

Dorking.

CYRIL E. BEARE.

The Future Capitation Fee

SIR.—The nation will get the medical service which it deserves provided it is prepared to pay for it. For an adequate service it will be necessary to recruit many more doctors, and to ensure this more money will have to be made available. In the view of many of us the main fault of the present arrangement lies in the inadequacy of the capitation fee under the N.H.I. Acts. As things are this service is subsidized by fees derived from private practice. In pleasant residential areas this subsidy will be adequate to provide a first-class insurance service, but in industrial areas where no such subsidy exists inducements to enter practice may be inadequate to attract sufficient numbers of practitioners. By reason of this and of the attempt made to do too much work for too little, it may not be possible to maintain the high standard of professional work of which these practitioners are capable, granted adequate facilities and proper amenities.

The Ministry has shown no recognition of this aspect of the situation. It has refused to increase the capitation fee and at the same time it has put into the insured category a section of the population who were formerly helping to subsidize the inadequate emoluments available under the service. If the B.M.A. would start off their negotiations

Sale of Goodwill of Practices

SIR.—In Dr. E. H. Strange's letter (*Supplement*, Sept. 25, p. 49) I can find no suggestion of how he would carry out the internal reform of discontinuing the sale of practices. My 25 years' experience convinces me that these contracts, as with similar ones in most other professions and trades, are usually honest and desirable, and that such investment of money—inherited, borrowed, or saved—is an additional incentive to good service and the maintenance of the good name of a practice.

It is true that the system has a disadvantage which would be removed if loans on easier terms than those now existing could be encouraged, but if general practice is to remain competitive, as I think it should, the only alternative is the use of about the same amount of capital to keep a doctor for some years until his practice keeps him.

Both of these systems are, I think rightly, now in use and act as a corrective to each other, but neither will prove a good investment unless a doctor obtains and maintains the confidence of the majority of his patients, and in my opinion this is a truer test for reward than the approval of a senior medical officer or committee in a State Medical Service.—I am, etc.,

Basingstoke.

CHARLES COBB.

Utilizing Nurses in General Practice

SIR.—Shortage of doctors is used as an argument against any drastic reorganization of our health services. It is true that general practitioners are overworked, but much of our work is not medical, and we are both nurse and doctor to our patients. We general practitioners spend a large portion of our time in routine supervision of illness, which in hospital is done very efficiently by nurses. If we were relieved of some of this we could devote more time to the work in which we have been trained—the clinical and pathological investigation of disease. The work of consultants would be correspondingly reduced. Existing medical training seems rather extravagant for general practitioners who, through lack of time and facilities, are

A Question of Man-power

SIR.—Yesterday I picked up a copy of a Sunday paper in which there was a article that set out to prove the general debility of the medical profession and concluded with the possibly rhetorical question, "What are the doctors going to do about it?" The facts stated in the article were actually fiction, and the writer—like so many others—had no constructive criticism to offer. If any of the old mystery still attaches to the medical profession then this author is purely an iconoclast.

A little clear thinking should make plain that if a State Medical Service is to be a success the first essential is that the doctor shall have time in which to do his work. Under present conditions the doctor has not nearly enough time to do his work as he would wish, and it would be no solution of the problem to take all the doctors in any given town and make them see all their patients in one central clinic as a team.

One reason why there is so little time at present is the general shortage of medical men. The advent of peace will do something to correct this, but there will still be too many patients to allow the proper and careful examination of each one. Further, under a State Medical Service patients will, as under the panel system, resort to the doctor for minor or even imaginary ailments and every doctor knows that it takes much longer to make sure that there is nothing wrong with a patient than it does to diagnose obvious disease.

Therefore, before a State Medical Service can hope to work efficiently it will be necessary for the State to see to it by scholarships, subsidies, or what you will, that an adequate number of students qualify in medicine during the next seven years. When this has been done, and not until then, will a full State Medical Service become a possibility with any hope of success.—I am, etc.,

Workop.

GAVIN DUNLOP.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 30 1943

THE FUTURE OF MEDICAL SERVICES

The Representative Body of the B.M.A., at its meeting in September, amended in varying degree the basic principles which the Council had put before it, and which were set out in the Council's Supplementary Annual Report (August 7, p. 19). The amended versions, with a full report of the discussions which led up to them, are distributed over three subsequent issues of the *Supplement*. For the greater convenience of the profession, therefore, we give below the principles in the order and form in which they were agreed by the Representative Body. The preamble is a reaffirmation of the principles on which the Association planned its General Medical Service for the Nation.

Preamble

(i) The system of medical service should be directed to the achievement of positive health and the prevention of disease no less than to the relief of sickness.

(ii) There should be available for every individual the services of a general practitioner or a family doctor of his own choice.

(iii) Consultants and specialists, laboratory services, and all necessary auxiliary services, together with institutional provision when required, should be available for the individual patient, normally through the agency of the family doctor.

(iv) The several parts of the complete medical service should be closely co-ordinated and developed by the application of a planned national health policy acceptable to the profession as a whole.

Principles

A.—The health of the people depends primarily upon the social and environmental conditions under which they live and work, upon security against fear and want, upon nutritional standards, upon educational facilities, and upon the facilities for exercise and leisure. The improvement and extension of measures to satisfy these needs should precede or accompany any future organization of medical services.

B.—The efficiency of a country's medical services, both preventive and curative, depends upon the available medical and scientific knowledge, upon the character and extent of medical education, upon the sufficiency and quality of personnel, upon facilities for treatment (including institutional accommodation), and upon the absence of any economic barriers that impede the utilization of such services. Thus, the sufficiency and quality of personnel and facilities for treatment (including institutional provision) should be assured; in order to improve the country's medical services the facilities and resources for medical research should be greatly increased and methods devised for their adequate application; medical education, both undergraduate and post-graduate, should be maintained on a high standard, adapted to modern needs, and brought within the financial resources of

any suitable student. Wherever economic barriers prevent an individual citizen taking advantage of medical services such barriers should be removed.

C.—Subject to these general and overriding considerations the functions of the State should be to co-ordinate existing provision, both official and non-official, to augment it where necessary, and to secure that it is available without economic barrier to all who need it. The State should confine itself within these wide limits, invading the personal freedom of both citizen and doctor only to the extent which the satisfaction of these functions demands.

D.—It is not in the public interest that the State should convert the medical profession into a salaried branch of central or local government service. The State should not assume control of doctors rendering individual or personal health service. The profession rejects any proposal for the control of the future medical service by local authorities as at present constituted.

E.—Free choice as between doctor and patient should be preserved as a basic principle of future health services, and no administrative structure should be approved which does not both permit and encourage such free choice.

F.—It is not in the public interest that the State should invade the doctor-patient relationship. The loyalty and obligation of a doctor rendering personal health service to an individual patient should be to that patient and to none other.

G.—Free choice of doctor should be reinforced by a method of remuneration which relates remuneration to the amount of work done or the number of persons for whom responsibility is accepted.

H.—Every member of the community should be free to consult the doctor of his choice either officially, as when he consults the doctor he has selected under an official service, or privately, as when he consults some other doctor, whether that doctor is a member of an official service or not. Nothing should be done to encourage the splitting of the medical profession into two groups—the official doctors and the non-official doctors.

I.—Consultants and specialists should normally be attached to the hospital. For those persons who wish to be treated in private accommodation, whether part of a hospital or not, private consulting practice should continue.

J.—The central administrative structure should be a corporate body concerned only with civilian health services and should be responsible for all civilian health services. This central administrative body should be advised on medical matters, including personnel, by a medical advisory committee representative of the medical profession, which should be at liberty to publish its findings. Locally, new administrative bodies, responsible to the central authority, should cover wide areas and should be representative, directly or indirectly, of the community served and, in appropriate proportion, of

the local medical profession and voluntary hospitals. They should be advised on medical matters, including personnel, by local medical advisory committees representative of the local medical profession, which should be at liberty to publish their findings. These administrative changes should be regarded as foundation changes to be agreed before other changes are initiated.

K.—All branches of medical practice should be regarded as a single service, and it is undesirable that a detailed scheme for general practitioners should be framed and put into operation without corresponding arrangements for other branches of practice.

Interim Proposals

L.—That, pending the consideration and completion of the foundation, administrative changes mentioned in J above, as a step towards the satisfaction of Assumption B there should be extension of national health insurance to include dependants of insured persons and others of like economic status and to cover consultant and specialist services and laboratory and hospital facilities as well as general practitioner service. The service should be improved from time to time as recommended by the profession. Those persons with incomes above an agreed limit could, if Parliament decides to make the service available to every member of the community, be permitted to become voluntary contributors to the extended service. A reconstruction of insurance committees would be necessary.

M.—There should be initiated, by arrangement and agreement between the Government and the profession, organized experiments in the methods of practice, such as group practice, including health centres of different kinds, which should extend to general practitioner hospital units attached to general hospitals. Future developments in group practice should depend upon the results of such clinical and administrative experimentation.

Further Decisions of the A.R.M.

The following additional recommendations relating to the future of medical services were also adopted:

1. In the opinion of the Representative Body the creating of a whole-time salaried State medical service is not in the best interests of the community. (This was carried by 20 votes to 10.)

2. This meeting would not approve of any extension of health services until the medical personnel is again available.

3. A comprehensive medical service should be available to all who need it, but it is unnecessary for the State to provide it for those who are willing and able to provide it for themselves.

4. There shall not be any extension of services under the National Health Insurance Act until satisfactory terms and conditions, including an adequate capitation fee, have been agreed.

5. All practitioners on the *Medical Register* shall have the right to participate in any health service.

COUNCIL AND STANDING COMMITTEES OF THE B.M.A.

FOR 1943-4

The Rt Hon. the Viscount Dawson of Penn,
 President
 Dr H. Guy Dain, Birmingham, Chairman of the Council
 Dr Peter Macdonald, York, Chairman of Representative Body

Correspondence

"Evolution, not Revolution"

SIR.—This is the heading of Mr. Somerville Hastings's letter (*Supplement*, Sept. 25) and he promptly proceeds to propound a revolutionary change in the medical profession because his plan "answers every doubt and difficulty raised by all other partial plans which Dr. Anderson rightly scorns." I like Mr. Hastings better than Dr. Anderson because he has thrown his hat over the fence and boldly jumped off the end of the pier in order to save the nation's health; I hope he is a good swimmer. What Socialists or Tories should give profound thought to is that the moment is the most inopportune for introducing any form of totalitarianism for reasons which must be obvious to all but those who think it might be easier to ram it through while the pick of the manhood and womanhood of the nation are debarred from voicing their opinion. In a Sunday newspaper Mr. Morrison states that the people are in the mood for Socialism. Are they? Wouldn't it be wiser to wait till the war is over and then test them. Leave State medicine alone now, at any rate.—I am, etc.,

St. Ossih.

R. G. CLARKE.

Medical Care of School Children

SIR.—The recent White Paper on educational reconstruction may at first sight appear to be of little more than academic interest to the medical profession, but paragraphs 93 and 94 concern us closely, especially paragraph 94. It reads as follows:

"The setting up of a comprehensive national health service will eventually ensure that all forms of treatment which school children require will be available to them through that service. When this stage is reached it will no longer be necessary for local educational authorities to provide treatment, and their functions will be confined to providing medical inspection and seeing that the children and parents are properly advised and encouraged to seek, through the new health channels, any treatment the children may need. Pending the completion of the new service, it will be necessary for local education authorities to continue their present provision and indeed to provide additional facilities for treatment. It is proposed, therefore, to make it the duty of local education authorities to provide for the medical inspection of all children and young persons attending grant-aided schools, and to take such steps as may be necessary to ensure that those found to be in need of treatment, other than domiciliary treatment, shall receive it. No charge will be made for medical treatment for any of these children or young people."

It is to be noted that the setting up of a comprehensive national health service is taken for granted, and that meantime it is proposed to provide free treatment, other than domiciliary, for all children attending grant-aided schools. This appears to me to constitute a considerable State-subsidized cut into private practice, and also to provide a means whereby very considerable pressure may be brought to bear in favour of the establishment of the already taken-for-granted State Medical Service.

It is nonsense to say that the education authorities are merely going to provide

treatment that the G.P. is unwilling or unable to provide; it is merely another illustration of the way in which public health services invade the territory of private practice. It is at least arguable whether the school medical officer can supply treatment in any way comparable with that offered by the family doctor, with his superior experience of treatment and diagnosis and his incomparably greater personal knowledge of the patient and of his home surroundings. However this may be, much is implied or taken for granted in paragraph 93, that merits consideration by the profession, for the implications have much to do with the larger question before us to-day—the question posed by Assumption B.—I am, etc.,

Wolverhampton.

VICTOR RUSSELL.

Demobilization

SIR.—In recent months many letters have appeared in the *Journal* from serving M.O.s, but none has mentioned the problem of demobilization and future service with the Armies of Occupation; there seems little doubt that the latter will be formed. The general impression prevalent is that those with the longest service will be demobilized first; this seems quite fair at first, but what of those M.O.s whose careers have been such that since qualifying they have had no clinical experience? I know of many young M.O.s who, since qualifying, had approximately 3 months as house officers and then had to join the Forces. Since joining up they have spent their time in field ambulances—the last place where medical duties are performed—and as unit M.O.s. It can be truly said that they have had no experience in medicine since qualifying. Surely they deserve some consideration. One must remember that those who joined the Forces in 1939–40 had had a good deal of hospital and G.P. experience, and should get an early release.

Lastly, who are going to be the M.O.s in the Armies of Occupation? Are the M.O.s with least service going to be retained? Personally I feel that those who have been in the E.M.S. service gaining experience and taking higher qualifications if they so desire should be called up for this job. The question of medical categories will not arise, and in any case there are sufficient A.I. men in the E.M.S.—I am, etc.,

SERVICE M.O.

Coming Events . . .

SIR.—A fitter in an aircraft factory came to my surgery last night suffering from inflammation of the skin over the patella with a large area of erythema spreading around. The body temperature was raised to 101° F. At the factory, he told me, a very nice x-ray plant and electrotherapeutic department had recently been installed. A précis of his story runs as follows: Seven days ago he consulted the works doctor because of a spot on his knee. The doctor glanced at it and ordered an x-ray "to see if there was anything in it." The x-ray showed that there was nothing in it; so after another cursory examination he was relegated to the nurse in charge of electricity for "ultra-rapid wave treatment." This treatment was continued until the patient departed for home.

I do not wish to argue from the particular to the general, nor to lay too much stress on the report of a patient. The value of the story to my mind

depends upon its implications, which I believe lie at the root of much of the fear and distrust among medical men of a comprehensive medical service—money to burn where equipment is concerned: x-rays *ad lib.*, and no need to count the cost; references through a chain of special departments certainly if only to protect oneself: nurses, masseuses, electricians, stenographers, statisticians: everything, in fact, except the doctor.

Now these fears we hope are groundless, but I do not think they are entirely fantastic. It would be a great relief to know in advance, before the old order is broken down, that they cannot, and shall not, be allowed to materialize in the new. This is an age in which the nations bow the head before the machine; and medicine—perhaps because of its peculiar blend of science, art, and craft—seems to be specifically prone to the fuddling influence of the pseudo. Let us then concentrate our thoughts for all we are worth on the central aspect of our calling, in which case we can safely leave the humanitarian side of it to look after itself.—I am, etc.,

Storrington.

W. R. E. HARRISON.

Faults and Remedies

SIR.—The letter from Dr. Terence Turner (*Supplement*, Sept. 25, p. 47) is very much to the point. The majority of the public and medical men agree that there is room for improvement in the health services of the nation, but I maintain that the faults are not to be found in the services or accounts rendered by the general practitioner. What are, then, the predominant faults and immediate needs of our present health services? I will enumerate the chief difficulties which face the general practitioner and hamper the health and happiness of the nation: also, I will endeavour to propound a scheme for their remedy.

The difficulties are: (1) Inability at present to get the necessary laboratory tests carried out on the poorer class of patients without sending them to hospital. (2) The overcrowding of the out-patient departments of our hospitals. (3) The great and crying need for more hospital beds for all classes of patients, but more especially for early malignant and chronic cases. (4) The lack of accommodation for the infirm and old unless they are sent to the Poor Law institution with its prison-like surroundings and its attendant stigma.

The remedies are as follows:

(1) In the great majority of cases where the diagnosis is difficult the practitioner does not lack the knowledge to interpret the meaning of laboratory reports, but he does lack facilities for having these tests carried out except in the case of his more wealthy patients. The whole country should be divided into districts, each of which should be supplied by a central clinical laboratory staffed by appropriate specialists. The general practitioner could then send any patient to have blood examinations, test-meals, x-ray examinations, autogenous vaccines, etc. He would also be able to have a personal interview with any member of the laboratory staff. If after receiving the data thus provided he is still doubtful regarding diagnosis or treatment, the case, together with the full literature, could be sent to hospital for a physician's or a surgeon's opinion.

(2) These arrangements would relieve enormously the number of patients attending the out-patient department of the hospitals, where often at present the

FUTURE MEDICAL SERVICES

Corrigendum

particularly unfortunate misprint crept to the Supplement of Oct. 30 (p. 75), in motion before the A.R.M., that "a whole-time salaried State medical service is not in the best interests of the community" was carried by the large majority of 200 votes to 10, and not 20 to 10 as stated.

THE AYLESBURY PLAN

BY

RAYMOND GREENE, D.M., M.R.C.P.

*Chairman, Aylesbury Medical Planning Group
(B.M.A.): a Representative of the
Buckinghamshire Division, A.R.M.,
Sept., 1943*

This paper is an abstract of the views which I have expressed from time to time to the Planning Group of which I am chairman.* These views were first formulated during my enforced inactivity during the "phony war." Many of them have since been advanced by others, and some have become almost generally accepted. Nevertheless I give them in full here because, although many of them by no means new, it seems wise to include them in order that the plan which I am presenting may be complete.

It is now generally admitted that the present organization of the health of the country is entirely inadequate and that it should be radically reconstructed. A gradually increasing number, both within and without the medical profession, are tending to the belief that the health of the people can only be ensured by the central control of all relevant services. For many years no suggestion for bringing this about was forthcoming except that of control by the Ministry of Health. Recently a suggestion has been made from many quarters that some other form of central control, based perhaps on one of the semi-autonomous Government boards, would be a feasible alternative.

The ultimate control of the health of the people is a matter for the people themselves, and must therefore be controlled by Parliament and not by doctors or by any medical organization. On the other hand, communal health can only be assured if the medical profession is contented with its terms of service. For this reason I am convinced that an organization centred in the Ministry of Health is bound to be unsatisfactory. The majority of doctors are strongly individualistic and independent in outlook. They have been trained from early years to accept full personal responsibility for all their actions and to maintain direct personal touch with those for whom they work and with those under whom they serve. The Civil Service tradition, adequate though it may be to maintain efficiency in many

branches of public government, is one entirely foreign to the mentality of most doctors. I have had much recent experience of the sense of frustration which Civil Service methods can induce in men who are accustomed to more direct dealings and personal responsibility.

The suggested alternative to the Ministry of Health is one far more likely to secure the support of doctors in general and, I am convinced, far more likely to lead to efficient organization of the public health. In the scheme that follows, this central organization is referred to as the National Board of Health.

National Board of Health

The National Board of Health would consist partly of appointed members, partly of *ex-officio* members, and partly of elected members. Its functions would be the control of medical policy for the whole nation and the control of all medical funds. It would be the adviser to the Government of the day on all medical questions and would have power through its chairman to initiate medical legislation in Parliament. Its chairman should be either a Secretary of State for Health with a seat in the Cabinet or, alternatively, a full-time officer acting as intermediary between the Board and the Secretary of State.

The appointed members would be appointed either by Parliament or by the Privy Council, and would be laymen. It is possible that the majority of them would be laymen who had shown a strong interest in the past in medical organization and were intimately acquainted with its problems. The *ex-officio* members would be the Presidents of the Royal Colleges of Physicians and Surgeons and of the British Medical Association. The elected members would be the chairmen of a number of consultative councils, the constitution of which will be described afterwards.

Regions

For the purposes of all health administration the country would be divided into regions according to the system of the Nuffield Trust. The regional councils would control not only the hospitals in their respective regions but the public health services and preventive medicine and the treatment of the sick—including general practice, the care of the chronic sick and the mentally deficient, health propaganda, and ambulance services. In fact, all questions concerning the health of the inhabitants of the region would be the province of the regional council and of nobody else. The regional councils would be financed by the National Board of Health, and would be to a very large extent autonomous. The National Board would have powers of inspection and, by means of its control of finance, would be able to exercise such ultimate control over the regional councils as it might find necessary.

The Advisory Councils

The National Board of Health would be advised by a number of elected councils, whose chairmen, as explained above, would be members of the Board. These councils would consist of members of the medical profession elected by their peers for periods of five years. It is essential that they should remain active members of the profession, for experience has shown that doctors who become whole-time administrators rapidly lose touch with medical opinion in the world outside. The members of the councils would be adequately paid in order that they might be the gainers rather than the losers by their election. They would be elected on a regional basis.

1. *The General Practice Council.*—This would consist of general practitioners representing the general practitioners of different regions. Its functions would be the supervision of general medical practice throughout the country, its powers being exercised by its right at any time to advise regional councils on the one hand and the National Board of Health on the other.

2. *The Public Health Council.*—This council would consist of representatives of medical officers of health, who would be employed by regional councils. Medical officers of health would in future be the advisers and not the servants of local governments. Their opinions would in this way carry far more weight, and it would be possible for them, through the Public Health Council and the National Board of Health, to bring far greater pressure to bear on local government authorities.

3. *The Hospitals Council.*—The work of this council would be the supervision and inspection of all hospitals, of every kind, throughout the country. The present arrangement by which hospitals are run by innumerable different Government Departments, local governments, and private bodies would cease and their financial control would rest with the council, elected on a regional basis by the hospital physicians and surgeons.

4. *The Research Council.*—This council would be precisely similar to the Medical Research Council as it exists to-day. The Medical Research Council is interesting as an example of the efficiency and lack of friction with which a semi-Government Department may be run by doctors, the majority of whom are part-time administrators.

5. *The Disciplinary Council.*—This council would be, in fact, the General Medical Council as it exists to-day, but concerned only with the disciplinary activities of this council. Consideration should be given to the question whether doctors should have the right of appeal against its decisions to the High Court.

6. *The Council of Medical Education.*—This council, consisting of the elected representatives of the teaching schools, would assume the educational functions of the General Medical Council.

7. *The Council of Popular Education.*—This council, the members of which would be nominated by regional councils and by the Board of Education, would be concerned with health propaganda through schools, broadcasting, cinemas, posters, newspapers, etc.

8. *The Pharmaceutical Council.*—The time is clearly approaching when the high standard of knowledge now required of

* It has been accepted in 1940 by the Aylesbury Group, and in 1942 was largely accepted by the Buckinghamshire Division of the B.M.A.

Correspondence

Medicine under State Control

SIR,—I have received the following letter from a relative serving with the R.A.M.C. in the Mediterranean theatre of war, in reply to questions about his views on medical politics and the future of medical practice:

"Medical politics: A year ago perhaps I might have given you an opinion. Now, however, I feel too divorced from peace and home to give it serious attention or even to remember the problems.

"My impression is that I, and probably most of the general duty M.O.s out here, think in our heart of hearts that complete State control is the only answer. For one thing, we can't hope that the State will finance and not control; for another, the administration of the Army in action is really getting good—it impresses us. We cannot disguise that central control makes for efficiency. In an Army at rest the inevitable red tape and excess paper creep in, of course, and that is how it would be. But none the less, I think complete State control would be the most efficient method and would confer the greatest benefit on the nation.

"Another very big influence with us M.O.s in the field is that almost our entire job is preventive medicine. We maintain health and prevent disease. If a chap gets ill, we have failed. He is evacuated. We never treat. We have no interest in curative medicine. Our whole training is designed to this end. We are all very experienced now in preventive medicine. We are impressed with what can be done by hygiene. We realize its importance in the future. Have you seen the M.E. statistics (medical)? They are incredibly satisfactory. All due to preventive medicine. In our heart of hearts we know that we cannot practise preventive medicine in private practice.

"Individually we don't like the idea of State control. To us peace spells liberty and freedom from control. Also we know that we have forgotten our medicine, that we are getting old. We fear that the State jobs will go to the young chaps at home with higher degrees and specialized knowledge.

"Finally, we should obviously base our 'medical politics' on the results of the experiment made in New Zealand."

The writer of this letter was in general practice for six years before the war, and has served with the R.A.M.C. over-seas since June, 1940. I am not disposed to defend or attack these views, but only to point out that many men with long service over-seas are in no position, and still less in the right frame of mind, to plan for the future.—I am, etc.,

Ipswich.

RONALD JONES.

Locumtenents' Fees

SIR,—At the Fife panel practitioners' annual meeting held on July 18 the question of the increase of locumtenents' fees since 1939 was considered at considerable length. Grave dissatisfaction was expressed at the increased fees demanded and the attitude of the B.M.A. as reflected in the advertisements in the *Journal* by doctors wishing such posts. It was the unanimous finding of the meeting that I should voice strong protest at the continued rise in the fees demanded and at the direct encouragement given by the B.M.A. by inserting such advertisements—e.g., July 10, "a 2-weeks seaside locum, hospitality wife and child, twelve guineas weekly."

We cannot understand our official publication directly encouraging this exploitation of the general practitioner and demand that such advertisements in future

be refused. We realize that this is a democratic country and that the basic principle we are fighting for is freedom, but we also realize that we are at present waging total war which necessitates temporary curtailment of freedom of action in our profession as in other spheres.

The question of locumtenent supply in death vacancies—a heavy drain on the estate—until a purchaser is found, in carrying on a disabled doctor's practice, and in making possible a holiday for the overworked doctor with a relatively small income, has given me considerable thought. So far as I know no concrete scheme has yet been considered to ensure "leave" for the general practitioner who is carrying on his shoulders the additional work of absentee doctors on service, Civil Defence, certification, medical recruiting boards, Ministry of Labour referee work, etc. Every civilian practitioner should find it possible to obtain an annual holiday, not only in the interests of his own health but on the ground that he would do better work. The tendency with many doctors at present must be to become tired both mentally and physically.

I fail to see why a scheme to ensure a locumtenent service for the civilian doctor has not been initiated long ere this by the B.M.A. and the Central Medical War Committee acting in collaboration in each area. Every new graduate in medicine is subject to the National Service Act. I understand the C.M.W.C. has power to direct a graduate into the hospital service but not into civil practice. I suggest that the required number be directed into hospital service and the remainder be available on application as locumtenents for doctors temporarily unfit or in need of a rest. Locum work may be spasmodic at times; I therefore suggest to ensure continuity of service that the Government employ a certain number of doctors in E.M.S. hospitals who would be available when required for such duties. This scheme would ensure a steady supply of young doctors for hospital posts and reliefs for civilian practitioners.

The fee for a locumtenent should be definitely fixed for the period of the war. This would put an end to the pernicious practice at present existing which enables the highest bidder to obtain a locumtenent, and makes it impossible for the doctor in less fortunate circumstances to compete, thus robbing him of the vacation which he usually requires more than his richer colleague who often enjoys the advantages of a partnership.—I am, etc.,

F. McEWEEN SINCLAIR,
Chairman, Fife Panel Committee.

Recollections and Reflections

SIR,—What has been termed group practice, health centre, etc., has not had the necessary time given to its clarification. A few notes from an advocate of over 40 years should be of interest.

As a student I decided that for efficiency of service the general practitioner must form one of a team; experiences of practice confirmed this and indicated the ways of implementing. The proposals by the Government to introduce a scheme for health insurance seemed to present a golden opportunity for the profession to take positive action; the Bill as introduced and the reactions of the profession were grievous disappointments. I condemned the Act as being unworthy of our country and our profession. I put forward my own ideas as

the better alternative—a group practice scheme based upon small general hospitals serving the whole community and financed by insurance, by contributions, and by private payments, practitioners or home doctors being supplemented at the hospitals by consultants, pathologists, psychologists, etc. I was usually listened to with interest and ruled out of order: I realized when it was too late that I ought to have thought out amendments instead of a whole alternative. I stressed the importance of recognition of the rapidly increasing complexity of medical science; adoption by the whole profession of a positive attitude, and acceptance of responsibilities for teaching health of body and mind, regarding the family as the unit; periodic overhauls by the team; compilation of private dossiers to be registered under a number and preserved as secret; the need for lectures and social services under advice by a local medical committee elected and appointed as representative of all types of health services. I made many prophecies, among these that the Act would commercialize a noble profession, lower its status, and lessen people's respect; that it would attract a different type, one less filled by love of humanity; that it would tend to increase functional disorders rather than lead to early discovery of organic diseases; that it would perpetuate rather than correct existent errors; that its gaps and deficiencies, particularly in neglecting the families, would be filled by other State measures; that the profession were throwing away their golden opportunity, possibly never to recur, and were extinguishing the family doctor and replacing him by a medicine-giver and certificate-writer; and that the only good point of the Act was that which they appeared to be chiefly concerned in fighting—namely, the provision of definite payments for a very large class of people previously treated by charity or semi-charity. These prophecies were not approved and undoubtedly cost me sympathy. Have they been fulfilled?

War experience and war service confirmed the rightness of my plans and turned me very strongly against administration under a State service. The Dawson scheme was published in 1919. There were points of similarity, but buildings and architecture and central organization were set forth prominently; in contrast local development around small general hospitals with decentralization or building up from the periphery formed the foundation of the group scheme.

In 1931 a committee for planning a medical service for the nation was appointed by the B.M.A.; on this I was co-opted as an advocate of the group scheme. Many of my points were incorporated, but the scheme as a whole was rejected on the ground that it might be used as a means for introducing a State Medical Service. I endeavoured to show that it was a compromise, substitute, and safeguard, but I was unsuccessful. It is of interest to note that the profession as a whole rejected my points so that most of them were omitted from the amended scheme of 1938. The Planning Commission of 1942 brought ideas of group practice and health centre into the light again; but by reason, I feel, of the use of this term by the Socialist Party, they have not had the sympathetic consideration which they merit.

Nottinghamshire, and Nottingham will be the object of ascertaining their views on a full-time salaried State Medical Service and the extension of national health insurance.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 13 1943

ANNUAL PANEL CONFERENCE

The annual conference of representatives of Local Medical and Panel Committees was held in the Great Hall of the B.M.A. House, London, on Oct. 28. Dr. J. A. BROWN (Birmingham) was chairman of the conference and was supported by Dr. E. A. Gregg (chairman of the Insurance Acts Committee) and Dr. H. Guy Dain (Chairman of the B.M.A. Council). At the beginning of the conference a message was sent to Dr. G. C. Anderson, Secretary of the Association, who is ill, expressing the hope that he would make an early and complete recovery.

INSURANCE CAPITATION FEE

Dr. GREGG read the following letter, dated Oct. 21, from the Ministry of Health:

"I am directed by the Minister of Health to refer to your letter of Oct. 8 and previous correspondence relating to the remuneration of insurance practitioners, and to say that he and the Secretary of State for Scotland agree in principle that a wartime increase in the capitation fee should be granted on account of the increase in the cost of living, under conditions as nearly as possible similar to those which apply to the remuneration of civil servants, and they are willing that the increase should operate as from April 1, 1943.

"The circumstances of practitioners who are paid by fees for part-time services differ widely from those of officials remunerated by fixed salaries for whole-time service, and as the Association realize it will not be practicable to devise a scheme which would give every individual doctor precisely what he would receive under civil service conditions.

"It is suggested, therefore, that the most equitable plan would be that a wartime bonus should be granted to insurance practitioners whose total net professional earnings from all sources do not exceed £850 a year.

"The bonus payable to a full-time civil servant who earns between £500 and £850 per annum is £25, but in view of the part-time nature of the services rendered by doctors under the National Health Insurance scheme the actual amount of bonus payable will have to be related in some way to the amount of the capitation fees.

"The calculation of the amount of bonus appropriate to practitioners with National Health Insurance incomes of varying amounts should, therefore, it is suggested, take the form of a percentage of the total amount of the capitation fees received by them—the percentage figure being fixed so as to take account of the fact that some part of these fees is absorbed by practice expenses.

"If the Association accept this offer in principle, the Minister and the Secretary of State will be glad to examine the matter further with them with a view to determining the appropriate percentage."

Dr. Gregg described the letter as an entirely unsatisfactory document, but knowing the Ministry as he did from past experience in other relationships he felt that it might provide a foundation upon which some kind of further discussion might take place.

It was agreed to postpone the consideration of the letter to a later stage

in the meeting after representatives had had an opportunity to study its contents. Meanwhile the discussion on certain motions dealing with the capitation fee in general was taken.

Dr. A. T. ROGERS (Kent) moved to ask the Insurance Acts Committee to press for immediate arbitration with a view to securing a wartime increase. Their case was based on the shift of insurance risk, the increase in short-term sickness, and the number of patients who came to their surgeries debilitated and war-weary and desiring some form of treatment which would enable them to remain at work. The motion was supported by Dr. J. H. BENNETT (Kent) and Dr. H. R. CRAN (Surrey). Dr. S. WARD was doubtful as to the wisdom of instructing the committee to apply for arbitration at the present moment; resort to this procedure should be left to the committee's discretion.

Dr. GREGG said that they were faced with many conflicting issues at the present moment, and it would be inopportune to embark upon the presentation of their case in the existing situation. He would love to do it, but it would be wise to be patient. Dr. ROGERS said that if arbitration were not accepted there were only two other possibilities—to accept the Minister's decision or to withdraw service. The motion was lost.

Dr. K. WATSON (Surrey) moved a resolution deploring the delay on the part of the committee in collecting information from Panel Committees regarding the probable degree of support upon which they could count. Dr. T. J. COSTELLO (Lancashire) strongly supported this motion, especially in view of the Minister's letter. Dr. J. A. PRIDHAM (Dorset) thought this was the wrong way to go about it. When the time came the Insurance Acts Committee must say what they were to do. They had access to information and could take a wide view. Dr. A. CAMPBELL (Accrington) supported the motion. Dr. F. M. ROSE (Preston) said that they were tired of hearing from their constituents that the Insurance Acts Committee did nothing; they wanted to know what their constituents were prepared to do.

Dr. A. S. WINSTANLEY (Lancashire) stated that a few weeks ago the Lancashire Panel Committee, of which he had been chairman for 15 years, passed a resolution of no confidence in the I.A.C. because it had not taken this step. The committee asked him to support that resolution, but he said that he could not conscientiously do so, and as the committee then passed a resolution directing its representatives to support it, he had no alternative but to resign his chairmanship of the Lancashire Panel Committee. He told his committee that there would in the future be a bigger fight than any on the capitation question, and he believed they would have the sympathy of the public in that fight; but if at this stage

they brandished the weapon of the strike they would alienate the public and the Press.

Dr. A. V. RUSSELL (Wolverhampton) said that it would be a tactical advantage to the I.A.C. to know what support could command, but it should be made clear that there would be no strike against their patients or refusal to treat them. Dr. J. HALLAM (Stoke-on-Trent) said that he represented a very militant group of medical men, but his group had not allowed its righteous indignation to war its judgment. In the battle of the capitation fee the rank and file would not be prepared to go the length of resignation. The issue had been overshadowed by the forthcoming White Paper.

The motion by Surrey was lost.

The Minister's Offer

The conference then considered the Minister's offer as expressed in his letter of Oct. 21 quoted above, and Dr. GREGG moved:

That the I.A.C. be instructed to inform the Ministry that its letter of Oct. 21 is most unsatisfactory and to discuss this letter with the Ministry on the basis of an increased capitation fee for all insurance practitioners in consideration both of increased work and of increased cost of living.

Dr. GORDON WARD (Kent) moved a amendment:

That this conference notes with pleasure the declaration of the Minister that he agrees in principle that a wartime increase in the capitation fee should be granted on account of the increase in the cost of living, and instructs the I.A.C. to negotiate accordingly, claiming a further increase on account of increased work and not seeking to relate the amount in any way to the earnings or bonus of civil servants.

He could not agree that this letter was wholly unsatisfactory. An important point in the letter was the acknowledgment that the conditions of insurance practice were entirely different from those of civil servants. It was of no use starting negotiations by declaring that the letter was wholly unsatisfactory. He agreed, however, to a suggestion to delete from his amendment the phrase "with pleasure."

Dr. S. WARD (Birmingham) said that this offer was only equal to the tip which the head waiter at a big London hotel received after a dinner party. The Minister was really offering them £25 which was the bonus payable to a full-time civil servant, divided by half, because it was recognized that practitioners derived about half their income from insurance and half from private practice though this ratio was different to-day when private practice was subsidizing insurance practice to a greater extent than before the war. Therefore it came to an offer of £12 10s., which, less tax was equivalent to £6 5s. To say that this was most unsatisfactory was an understatement.

Dr. Gordon Ward's amendment was lost. The motion by Dr. Gregg was then put and carried with one dissenter. A motion in the name of Fifehire was also

if it more on the lines on which Dr. Leachamp had spoken. Dr. BOYDE said that if Dr. Gregg could give a categorical assurance that there would be no two-way extension without a substantial increase he would withdraw the motion. Dr. GREGG said that before the question of the two-way extension could arise the matter would have to come before the conference and the question of remuneration would then come forward.

The motion was carried.

On a motion by Inverness requesting further information from the Representative Committee with regard to the Government's latest offer, Dr. DUN said that there had been considerable misunderstanding over this question of secrecy. Certain documents were produced by both sides in the conversations with the Ministry, and it was decided not to publish any of these documents. But the results of the conversations and the form they took were not subject to the same privacy. There had not been at any time any formal offer to the profession. In one of the documents a series of salaries was suggested, but received no approval; by some mischance this document got into the hands of the Press. The point of view of the Ministry was to create a number of centres all over the country for the running of a whole-time salaried service, to invite doctors now in practice to take their practices into the centre and work on a part-time basis, and to have newly qualified doctors come in completely whole time. The conversations were on the basis—the only basis the Ministry would then consider—that a service was to be provided for 100% of the population. The Representative Committee made its points, which were set out in the Principles since adopted, with almost no modification, by the Annual Representative Meeting. It was hoped that they had modified the Ministry's original suggestions, but to ascertain this the White Paper must be awaited. The delay had given opportunity for taking the opinion of the Representative Body, which showed that the committee had not misinterpreted the feeling of the profession. There were no "offers" and never had been. When the White Paper came out a questionnaire would be sent to every practitioner at home and abroad.

The Inverness motion was withdrawn.

Dr. J. H. E. MOORE (Leeds) moved that in the event of extension to include dependants the role of the approved societies should be that of collecting and distributing agents only. They did not ask for the abolition of approved societies—only for the limitation of their activities. The approved societies did not represent their members in any democratic sense, though on the claim to such representation they had secured 60% of the membership of insurance committees. Dr. F. R. ROSE supported the motion and was prepared to go further. The whole business of the approved societies should be thrown into the melting-pot and one central agency instituted for medical benefit.

The motion was carried.

Dr. A. W. HALL (Hampshire) had a motion deploring the acceptance by the I.A.C. of the inevitability of a comprehensive medical service. Dr. GREGG said that they had accepted the principle of a comprehensive medical service in association with the State from the time when the scheme for the General Medical Service for the Nation was put

forward. He did not see the bearing of this motion.

The motion was lost by a very large majority.

Preservation of Family Practice

Dr. J. KERR (Cheshire) moved:

That the family doctor should be the pivot of any future system and that all the advantages desired for the patient can be provided if hospitals fully equipped are available in which his doctor can either conduct examination and treatment or remain in touch with him if he places him under the care of a specialist.

Owing to the development of hospitals there had been a decline in the opportunities of the family doctor to give an adequate medical service in the home. Nevertheless, the life of a patient in a grave abdominal emergency depended as much on the skill of the general practitioner who made the diagnosis and initiated the treatment as upon the surgeon. Even midwifery, that stronghold of the family doctor, and at times comparable with major surgery in its skill and hazard, was passing into institutional hands. The Ministry had said that the new health service must be based on the family as a unit and the general practitioner as primary, attendant. If that be so, the family doctor must have a high standard of efficiency and the capacity to render full service to his patients. The young graduate in medicine was launched on his career with a knowledge of the science and art of his profession, but the best general practitioners were those who had undertaken the intensive experience and responsibility which resident hospital appointments could give, and the family practitioner who became honorary medical officer to a general hospital or to his local cottage hospital was thereby enabled to give a more comprehensive medical service. The new health service should provide hospitals fully equipped where the family doctor could conduct the examination and treatment or at least remain in touch with the patient. The proposed new regional hospitals should provide general-practitioner beds.

Dr. J. BARRY BENNETT (Cheshire), in supporting, spoke of the isolation in which general practitioners worked. They sometimes consulted with specialists, but seldom with other general practitioners. Dr. S. WARD said that the motion stressed for the first time an aspect which had not received open attention. He was convinced that the fundamental principle behind all improvements was the constant association of the general practitioner with hospital life. Dr. GREGG said that he was entirely in agreement with the point of view that every doctor should be directly associated with a hospital in his neighbourhood; at the same time there were men who were a considerable distance from a hospital, for whom such association was impossible.

The motion was carried unanimously.

OTHER BUSINESS

The Position of Rural Practitioners

In requesting the I.A.C. to investigate the financial position of the rural practitioner and endeavour to improve it and to investigate the adequacy of the dispensing capitation fee, Dr. J. A. PRIDHAM (Dorset) said he had reason to believe that the total professional income of the rural practitioner from all sources was very frequently not more than £500, and that practically no rural practitioner had an income of more than £850. As to the 3s. dispensing capitation

fee, he mentioned the case of a rural practitioner firm who, during the five immediate pre-war years, spent on the average £196 a year on drugs, whereas the amount for 1940 was £255, for 1941 £246, and for 1942 £338. Dr. G. MACFEAT said that the list of the rural practitioner was as a rule only about half that of his urban colleagues. Travel entailed for him disproportionate expense, time, and discomfort, and possibly even risk, and this was not covered by the mileage allowance. No single improvement in rural practice would have such excellent results as the provision of cottage hospitals linked up with district hospitals. The more expensive drugs of the present day were a severe tax on the rural doctor. Dr. J. L. PICTON said that there would be no difficulty in getting the information about the financial position of the rural practitioner. They had it in Cheshire in respect of 7 practices.

It was agreed to request the I.A.C. to do as Dorset suggested.

Elections

It was announced that Dr. J. A. BROWN (Birmingham) had been re-elected unopposed as chairman of the conference. The announcement was received with applause. It was also announced that the following six members had been elected by the whole conference as members of the I.A.C.: Dr. T. H. BATES (Newcastle), Dr. A. Beauchamp (Birmingham), Dr. G. E. Elkington (Shropshire), Dr. I. G. Innes (Hull), Dr. J. A. PRIDHAM (Dorset), and Dr. F. M. ROSE (Preston).

On the motion of Dr. N. STEVENS the conference with acclamation extended its congratulations to the recently repatriated medical members of the Forces on their return to this country, and expressed its deep sense of gratitude for their self-sacrificing services rendered in conditions of very great hardship.

National Insurance Defence Trust

Dr. J. W. BONE, Treasurer of the National Insurance Defence Trust, said that the invested assets now amounted to £276,000, an increase of £6,000 on the year. So far 66 Panel Committees had agreed to make every endeavour to complete their quota to bring up the Fund to £1,000,000. He drew attention to the fact that the Trust was sharing on equal terms with the B.M.A. the cost of the Public Relations Department.

Dr. GREGG moved the rescinding of a resolution passed at the 1938 Annual Conference whereby grants were made to aged or infirm insurance practitioners whose means were straitened, and against whom, in consequence of such age or infirmity, a complaint had arisen or was likely to arise. He explained that there was no intention to deprive anyone of any allowance, grant, or pension they were already receiving, but it was felt that there was a tendency for this provision, which was of an experimental character, to be looked upon as in the nature of charity.

The motion was opposed by two representatives, but was carried. A motion by Dr. J. G. F. HOSKEN (Gloucestershire), that any financial support granted to practitioners who required it owing to action taken by them in accordance with policy laid down by the conference should be in proportion to the contributions paid by their area, was not carried.

ANNUAL PANEL CONFERENCE

Dr. Dain said that he thought Dr. Pridham's criticism extravagant and very

The *Journal*, in spite of many difficulties, was rendering splendid service to the Association and the profession at this time. ("Hear, hear.") on the part of such individuals. He estimated that the delay did not on the average involve any individual practitioner financial loss, but it was an intolerable hardship to be made better.

[illegible]

On a motion by Gloucester A. W. Weston (D.) the report approving of medical treatment for the defendants of men in the Government provision of men in the Forces for the further words: "Provided that a guarantee be obtained from the Minister that any agreed capitation fee shall be without prejudice to a motion."

"That every opportunity should be taken by Southampton was also agreed to provide that an adequate capitation fee for insured persons on service in the National Health Insurance Scheme provided that an adequate capitation fee for this group of patients be previously approved."

Dr. G. de Swiet (London) asked the conference to express the opinion that it was undesirable that a pregnant woman should be employed on her work during the last six weeks of her pregnancy, as that financial provision should be made for accordingly. A similar motion was put forward from the last part of the meeting.

[illegible]

Dr. Gregg said that the committee had already been told that there were no special relations between the two men. He said that the committee had already been told that there were no special relations between the two men. He said that the committee had already been told that there were no special relations between the two men.

There were less than a dozen people at the London motion picture

the effect of wartime industrial health reports had already been factored in. Beauchamp (Birmingham) says that he has seen a case for a face mask in a factory and difficult hours and difficult conditions in large measure offset by the use of masks and the wearing of protective clothing. He says that the intervals of confinement would be more frequent than body would prefer and that as many as three months, but as many as a year, might have to be visited, often in a country where the weather would be most disagreeable. He agreed, should be made the least discretion.

Dr. Greco

the issue of a conval-

series of motions were on the agenda the name of Bournemouth, all concerned with the question of certification. Dr. WARD pointed out that they were the business of the General Practice Committee, which had these questions under its constant supervision. One of the motions related to Form E.D.652 Ministry of Labour and National Service, and what Bournemouth considered the inadequate remuneration agreed for the provision of such information. GREGG said that there were two points in view in the profession with regard to certification. There was nothing to compel doctors to use it if they did not want to do so, but a number of members of the profession had expressed great appreciation of the certificate. This and other motions were all referred to the General Practice Committee.

Miscellaneous Motions

On the motion of Buckinghamshire the conference expressed its great appreciation of the work of the L.A.C., especially as regards the results of the negotiations concerning new entrants, medical records of men discharged from Forces, sickness benefit in relation to pregnancy, certain aspects of certification, and the inclusion in the schedule of appliances of hypodermic syringes and needles for the self-administration of adrenaline for the treatment of asthma. A further motion by Buckinghamshire, that any special fee accepted for treatment of former members of the Forces discharged on medical grounds could be regarded as the basic capitation fee in being, plus a percentage thereof, was scussed with the Ministry. The idea originally was that they should be prepared to accept a payment of 16s. 6d. for these particular cases, but a little later the Ministry wished to apply this only to cases which were demonstrated to have deteriorated as a result of war service. It was now able to inform the conference that in a letter dated the previous day the Ministry had given way and was prepared to pay 16s. 6d. for all men discharged from the Services on these grounds. The matter would be dealt with on the lines of the Buckinghamshire resolution, which was agreed to by the conference.

Several other motions remained on the agenda, but in view of the late hour a motion was agreed to, by 36 votes to 21, that they all be referred to the Insurance Acts Committee for consideration. At an earlier stage a motion by Lancashire had been carried that one day was not sufficient for the Annual Conference, and that in future it should be called for two days. During the later part of the proceedings the time limit for speeches had been considerably narrowed.

The conference concluded with a hearty vote of thanks to its chairman, Dr. J. A. Brown, for his excellent conduct of the business.

practice at the level of the rapidly advancing front of medical science.

The national health service under Communism would be staffed by whole-time salaried officers. No two-way extension of national health insurance could provide a comprehensive service, nor could any employment of doctors on a capitation fee basis give a uniform distribution of doctors in localities in accordance with population needs. Health education by general practitioners or consultants is impossible under the present system. The party concedes, however, that doctors now in practice may be allowed to come in on a part-time basis. The Government must guarantee employment for all who have graduated and who are willing to undertake post-graduate study. There must be no sex or race discrimination.

Some national body, preferably the Ministry of Health, would determine from time to time the terms of service of health workers, including doctors. A Central Medical Board set up for this purpose would take over the duties of registration and assessment of standards of qualification. The General Medical Council would remain a purely disciplinary body and might well be replaced by small peripheral regionally elected tribunals. The Minister would have an advisory committee, including representatives of the universities, environmental health services, and hospitals and health centres. The members might be elected from an annual conference, like the present Panel Conference, which itself would represent local or regional medical committees elected by the doctors employed in whatever capacity in the service.

Bound up with the reform of public health is reform of local government, but the Communist Party view is that the national health service must not be held up to await such reform. It can be adequately operated by regional health boards consisting of elected representatives of local authorities in the region. Regions would have some regard to present county boundaries and populations, varying from one million to, in the case of London, six millions. The regional health boards would consist primarily of laymen, the elected representatives of the people, but should include a number of medical representatives. These latter would have no voting power, but would be able to put forward general and specialist medical opinion to the board. Administration would be carried out through a regional health office to include environmental medicine, and epidemiological, hospital, health centre, mental health, and industrial medical services. The heads of these departments would form a medical directorate, and would be advised by a committee consisting of doctors, nurses, social workers, and others. The public health departments of local authorities, administering environmental services, but not hospitals or health units, would remain as at present.

Voluntary and local authority hospitals should be managed by committees consisting of representatives of local and regional authorities and of all grades of health workers. "When hospitals achieve the maximum efficiency contemplated for a comprehensive service the need for special facilities for the rich will disappear." In each region at least one large hospital must be attached to a school of medicine. Health centres must be places at which health education as

well as treatment is afforded, and at which periodical examinations of the apparently healthy population should take place. They must be built on a generous but not uniform pattern, allowing for variation in local needs and initiative. On free choice of doctor by patients "there is no basis for controversy... the principle is universally accepted, and it is only limited by the number of patients that a doctor can efficiently look after."

Industrial medical services must form part of the comprehensive national health service; mental health services must also be incorporated, and research must be liberally financed.

Correspondence

The White Paper

SIR,—Before the issue of the Government's White Paper on the reorganization of the medical services would it not be possible to have the assurance: (1) That no fundamental changes shall be agreed upon without an opportunity for the whole profession to vote on such changes; surely this basic right cannot be denied. (2) That since capital has been sunk in practices adequate compensation will be paid if the recommended changes absorb such practices.

With these two assurances admitted everyone will be able without bias to consider whatever suggestions the Government may make. Without such assurances which of us can consider them without personal feeling? The suggestion made by the B.M.A. for extension of N.H.I. fails to meet the case, since again private practice will be absorbed into N.H.I. practice without compensation.—I am, etc.,

W. LEES TEMPLETON.

* (1) The Representative Committee, in reporting to the profession on May 22, 1943, asked for the continued confidence of the profession "on the understanding that at no stage will the profession be committed without prior consultation with it through the established machinery" (*Journal*, May 22, p. 641). The procedure to be adopted by the B.M.A. when the White Paper is issued was referred to in the Annual Report of Council (*Supplement*, July 10, p. 5). The Minister has undertaken to allow sufficient time for this consultation with the whole profession. (2) On the issue of compensation the most definite official pronouncement so far made by the Minister is his statement in the House of Commons on April 22 (*Journal*, May 8, p. 587) that the question of compensation for loss of value of practices would certainly be one of the subjects with which his proposals would deal.

B.M.A. Policy: Misunderstanding

SIR.—In the *Yorkshire Post* of Oct. 28 the following passages appeared.

1. In an article headed "B.M.A. Policy": "The B.M.A. Council called a special Press conference to clear up what they regard as misunderstandings of B.M.A. policy. . . . Dr. Charles Hill, Deputy Secretary to the B.M.A. Council, said that in the Association's view the importance of free choice as between doctor and patient could not be exaggerated."

2. In another article headed "Loose Drinkers of Medicine": "Dr. E. Vaughan Jones (member of the B.M.A. Council

FUTURE MEDICAL SERVICES: THE COMMUNIST VIEW

The Communist Party has submitted to the Minister of Health its proposals for a comprehensive national health service. Its plan is prefaced by the statement that it is intended to assist doctors to give their best services to the public, to obtain democracy in the profession, to free doctors from their present commercial relationships, and to keep medical

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 20 1943

GENERAL PRACTICE COMMITTEE OF THE B.M.A.

At the first meeting of the General Practice Committee for the new session was held the end of October, and Dr. S. Wand was re-elected to the chair. The sub-committees concerned with colliery and works practice, with Post Office medical officers, with ship surgeons, with public medical services, and with the industrial medical service were reconstituted. A report was made on the committee's proposals, put forward at the last meeting, concerning the fee for examination of employees under the Ministry of Supply. It was stated that the Department had accepted the proposals subject to the overriding maximum of £2 per day being limited to the examination of ten persons on any one day, and that the new rates ad now been in operation as from July and had been made applicable to all appointments. No difficulty was being experienced by the Local Medical War Committees in securing nominations of practitioners for this work.

Post Office and Fire Service: Capitation Fees

The capitation fee for Post Office medical officers had been discussed informally with the Chief Medical Officer of the General Post Office. It had now been agreed by the Treasury that the fee should be raised from 12s. to 12s. 6d., subject to review after the war or earlier if circumstances altered. One point brought out in the correspondence was that, although the Department admitted that owing to wartime difficulties Post Office capitation lists contained a greater proportion of older and more infirm officers than in former times, a very large number of Post Office servants retained after the age of 60 had nevertheless relinquished their established status at that age and as temporary officers were ineligible for free medical attendance. In discussion it was pointed out that the difficulty of accepting a conditioned fee for one section of the people was that it was then used as a precedent for another section. It was agreed, while not subscribing to the view that 12s. 6d. was an adequate capitation fee, to recommend members to accept it at the present juncture.

Following the increase in the capitation fee to Post Office medical officers, a similar increase was proposed by the Fire Service Department, who also suggested that this was an opportunity to bring into operation a graduated scale of payment in respect of higher ranks. The suggested figures were given in Dr. Wand's speech at the Annual Representative Meeting (*Supplement*, Oct. 2). One member of the committee asked whether a graduated scale might not carry awkward implications for the future capitation fee under National Health Insurance, but it was pointed out in reply that there were no means of sorting insured persons into salary classifications, whereas in such a service as the National Fire Service the

actual amount of remuneration is known and the capitation fee can be graded accordingly.

The committee agreed that it was prepared to accept as a wartime measure the suggested rate of 12s. 9d. for leading firemen, section leaders, and company officers, but it was not prepared to accept 12s. 6d. for the ordinary firemen as proposed; the minimum fee for all grades should be 12s. 9d. It was also agreed to ask that those over the income limit of £420 should have provision made for them on an item-of-service basis. The committee further adopted certain proposals made by the Isle of Wight at the Annual Representative Meeting, that it should not be obligatory upon the medical officer to supply drugs and dressings where he did not ordinarily dispense, and that the payment, if he did supply these drugs and dressings, should be not less than that paid under National Health Insurance; also that the provision for mileage should be payable above two miles as in the case of National Health Insurance patients.

Certificate Forms

Some resolutions had been received concerning the Ministry of Labour and National Service Form E.D.652, suggesting that the issue of this form was unnecessary or rejecting the idea of a uniform fee; but the CHAIRMAN of the committee stated that the fee was the ordinary one, used throughout the country more or less, and also that there was no compulsion on the doctor to use the form if he preferred his own, on which he could charge any fee he liked. The DEPUTY SECRETARY said that the idea behind the certificate was that doctors were having difficulty in getting a fee for this type of certificate, and the inclusion of the statement that the fee was the patient's liability was helpful. These certificates laying down the fee also helped to rebut the allegation that doctors were charging unduly large fees for this form of certification.

Discussion also arose on the Ministry of Pensions Form A.O.38. The view of the committee was that it was in the interest of the patient discharged from the Forces that the doctor should give the information required, but it was felt that the fee should be paid by the Ministry of Pensions to the doctor rendering the report.

Health of Women in Factories

Dr. DAIN presented the report of the Industrial Medical Service Subcommittee. Its recommendations regarding pregnant women in factories were adopted—namely, that the question whether work was likely to be detrimental to the normal pregnant woman depended upon its character and each case must be decided after careful consideration of all the factors involved; that ordinary factory work was usually inadvisable during the last six or eight weeks of pregnancy;

that a careful examination should always be carried out before a woman returned to work, and the most suitable time for this examination was at the end of the six weeks following confinement; and that it was desirable that it should be made economically possible for a woman employed in industry to breast-feed her child.

A final question dealt with by the committee was that of surgical belts and corsets. The SECRETARY said that he was meeting the Board of Trade with regard to the issue of certificates for the supply of these and required some guidance. Apparently the supply was being abused, and people were obtaining corsets who were not, on medical grounds, entitled to them. It was stated that there was an increasing tendency for people to go to the doctor and request certificates for all sorts of things which they had not been in the habit of having, and the doctor was often placed in an embarrassing position. It was suggested that it would be helpful if a list of conditions in which certificates for surgical belts and corsets would be justifiable could be drawn up and published in the *Journal* for the guidance of practitioners.

Correspondence

Future of Medical Practice

SIR,—I have long resisted the temptation to rush into print in the *Journal* on the matter of the future of medical practice, but can no longer rest without replying to the letter from the eleven Birmingham doctors, printed in the *Supplement* (Nov. 6, p. 82).

I beg to differ very much from the last paragraph of their letter, in which they state, after enumerating certain conditions, including a salary, that they believe "a full-time medical service, containing these conditions of service, would be welcomed by all doctors who entered the profession as a vocation. . . ." On the contrary, I believe that the great majority of the profession wish to be left alone to carry on general practice very much as they do now, with the addition of certain safeguards and improvements—e.g., easy access to biochemical and pathological investigation, health centres in selected areas, more chance of holidays, possibly pensions, etc. Continuing on this line, I feel certain that a whole-time salaried State Medical Service is not in the best interest of the patient or the doctor.

The "eleven doctors" fall into the common mistake of assuming that because salaried medical service in the municipal hospitals in our city is a great success and furnishes very excellent work, the same will necessarily apply to salaried general practice. In my opinion general practice can be compared with no other profession, trade, or with any other branch of medicine itself. The only possible comparison is with the

Further notice not to submit applications

The Central Medical War Committee has recommended additional posts for the up-grading of house officers. This follows a recommendation of the Medical Personnel and Promotion Committee that wartime medical establishments of hospitals should not for the present be increased and there should be no up-grading. Hospitalists are also asked to do similar proposals affecting medical personnel, pathologists at infectious diseases hospitals—which do not come under Central Medical War Committee's arrangement. The same circular states that war medical officers in whole-time public health appointments who are over military age were born after March 5, 1896, must obtain the permission of the Ministry if they wish to apply for other posts.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 27 1943

THE NATIONAL EYE SERVICE

A meeting of the Ophthalmic Group Committee of the B.M.A. was held at the end of October, preliminary to the conference of the various ophthalmological societies and other bodies summoned for the following day to discuss a draft scheme for a post-war National Eye Service. Some part of the proceedings of the committee was occupied with matters preparatory to that conference. Mr. O. Gayer Morgan presided.

Ophthalmic Reports for Ministry of Labour

Following upon a letter from a member it was agreed to take up with the Ministry of Labour the question of the fee to be paid to an ophthalmic surgeon when a case was referred back by a medical referee. In the case mentioned the referee had refused to furnish a certificate as he did not feel competent to give an opinion in the particular case, which was that of a workman who desired to make a change of employment. A local officer of the Ministry of Labour had suggested a fee of 10s. 6d. for the examination, and it appeared that ophthalmic consultants were expected to receive the same fee for their opinion as a general practitioner. It was agreed by the committee that the cases referred in such circumstances should be paid for at the recognized consultant's fee of three guineas.

A question was raised as to the position of officers in the R.A.F. in relation to the arrangements for the ophthalmic medical examination and the provision of Mark III spectacles to Services personnel at a reduced fee. The National Ophthalmic Treatment Board had agreed that the reduced fee of 10s. 6d. should apply to other ranks but not to officers, and the Air Ministry now asked whether officers could have the benefit of the reduction. It was added that probably few officers would wish to take advantage of it. The committee decided that the request could not be acceded to.

Fee for Ophthalmic Medical Examinations

The committee had before it a motion which had been referred to the Council from the Annual Representative Meeting for further consideration—namely, "That the scale of fees, for National Eye Service patients agreed to by ophthalmic practitioners, notified to all on the National Eye Service List, but later cancelled—namely, 10s. 6d. for insured and non-insured with family income of £250 or less, and £1 1s. for insured persons up to £420—be put into force at an early date." In the course of a lengthy discussion on this subject the committee was reminded by one member that the Ministry had said that it was not possible to differentiate between insured persons; nevertheless, the approved societies had the power to make a grant-in-aid. The member considered that this was a very important point. He thought that the approved societies should be informed that practitioners felt they had had rather a hard deal over this matter. He

suggested that a small committee be formed to meet representative approved society officials, and that together they should wait as a deputation on the Ministry of Health to get the subject cleared up. The guinea fee, he said, was not an increase; it was the old B.M.A. fee. The secretary of the committee (Dr. Anderson) and other members suggested that it would be reasonable at this stage for the committee to decide definitely that a higher fee was desired than had been received for the past seven or eight years, and to inform the approved societies that the fee would be raised.

It was agreed that the societies be informed that from the beginning of 1944 the fee for all insured persons entitled to be examined under the N.E.S. should be 15s., that for uninsured persons with incomes below £250 it should remain at 10s. 6d.; and that all other persons should be dealt with as private patients and should not go through the N.E.S.

The committee dealt with a considerable amount of other detailed business.

FUTURE MEDICAL SERVICES IN AUSTRALIA

The report (just received) for the year ending June 30, 1943, of the South Australian Branch of the B.M.A. contains the following reference to future medical services in Australia: "Notwithstanding the promise given to the Federal Council [of the B.M.A. in Australia] by the Federal Minister of Health that no major scheme of nationalized medical services would be introduced while so many medical men are serving with the Forces, Sir Henry Newland, as chairman of the Federal Council, was invited to attend a meeting of the National Health and Medical Research Council, at which consideration was to be given whether the whole or any portion of the latter's scheme for a nationalized salaried medical service should be introduced during the war. Sir Henry Newland declined to attend, and on behalf of the profession in Australia protested against the introduction of a salaried or other medical service without the fullest consultation with the profession, and while so many members were absent on full-time active service, as they would thereby be debarred not only from expressing their views on such a service but also from applying for posts in it should they desire to do so. . . . At the last meeting of the Federal Council a resolution was passed that the council is completely opposed to any drastic alteration in the form of medical service to the community during the war and for one year afterwards; also that, having ascertained the views of the medical profession in Australia, the council is opposed to a nationalized salaried medical service with consequent abolition of private practice. The scheme of the council for a General Medical Service for Australia has been recast. The Federal Council feels that a revolution in medical practice is undesirable and unnecessary for Australia, but improvements are obvious as expressed in the policy drawn up and referred to above. . . . The Federal Council is the body to express the views of the profession. . . . To implement any medical service a willing and contented profession is essential, and any revolutionary changes are not likely to be a success."

Correspondence

B.M.A. Policy: Misunderstanding

SIR.—The letter under the above heading (*Supplement*, Nov. 13, p. 87) calls for a reply. In these days of tabloid reporting it is inevitable that misrepresentation as well as misunderstanding should appear in the Press. Any single statement removed from its context may convey an entirely erroneous impression. It is unfortunate that subediting may make such a vital difference.

It is true that Dr. Charles Hill, speaking as the servant of the B.M.A. stating official policy, said that the importance of free choice as between doctor and patient could not be exaggerated—I am assuming he was correctly reported. In my remarks to the Yorkshire Branch of the Pharmaceutical Society I first gave the official policy of the Association as decided at the A.R.M. in September of this year. The Press were then informed that certain subsequent remarks were entirely my own personal responsibility. In quoting from a survey into statutory social services which had previously reported to B.M.A. headquarters and in which the following conclusion had been reached: "The importance of freedom of choice is far more implied than real," I made the statement that "I do not think that freedom of choice of doctor matters to the extent which is sometimes made out."

There was no intention of creating misunderstanding, because members of Council were not aware of the Press conference called by the Public Relations Committee apparently to counter the Press misrepresentation of the A.R.M. in September. Such opinions as I personally hold will be expressed vigorously by me on the occasions on which I am invited to express them, but in the true spirit of democracy the official policy of the Association will always receive the proper emphasis.—I am, etc.,

Leeds.

J. VAUGHAN JONES.

Health Centre Affiliated to Teaching Hospital

SIR.—The first health centre must obviously be experimental, and I have attempted below to give a rough outline of a scheme for the adoption of such a centre by a teaching hospital.

A health centre should be started near a teaching hospital willing to co-operate with a group of established practitioners. If several hospitals were able to take part, experiences could be pooled, and within a reasonably short time a basis for future health centres could be found. The doctors would do the whole or the bulk of their work at the centre, and the hospital staff would be available for evening discussions in addition to their ordinary consulting practice. The advantages of this to the doctor would be enormous, and the inspiration and drive of the teaching hospital would radically alter the scope of general practice. He would be

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 11 1943

THE B.M.A. AND PUBLIC HEALTH

The Public Health Committee of the B.M.A. at its first meeting as a new committee on Nov. 19 (when Prof. M. F. PICKEN was re-elected to the air) was confronted with a specially printed agenda running to forty closely printed pages, and the only way of covering such of it seemed to be by delegation. Accordingly a subcommittee of seven members was set up, with power to invite the attendance of persons with special knowledge of the subjects with which it would deal, to hold its first meeting early in December.

The first matter allocated to this subcommittee was the detailed consideration of two reports, one concerning maternity and child welfare services and the other midwifery. Dame Louise McLroy, who had been the Association's representative on the bodies responsible for these reports, attended the meeting and explained their bearing. One of them was the report of a planning committee appointed as the result of a recent conference under the auspices of the National Association of Maternity and Child Welfare Centres. Dame Louise McLroy said that when he criticisms of the different bodies represented were forthcoming a final report would be published. Various controversial points arose in connexion with the report, such as the staffing of small maternity homes and hospitals and the relation of the small hospital to the large.

The other report was a summary of the conclusions of a joint committee appointed at the instance of the Association of Supervisors of Midwives to consider future developments in the maternity services of the country. Here again certain controversial points arose, especially over the claim made in this report that it should be the duty of the midwife to decide whether or not a home was a suitable place in which to conduct a normal confinement. The feeling in the Public Health Committee was that while the midwife was a fairly good judge of this matter she should not be, as the joint committee apparently desired, the final arbiter. It also seemed to be assumed in this report that institutional midwifery was preferable.

Another question passed to the subcommittee concerned the memorandum recently issued by the Ministry of Health relating to the early diagnosis of, and financial allowances in, cases of pulmonary tuberculosis. Another question remitted—one which had previously been before the committee—was the desirability of securing an amendment of the vaccination law so as to facilitate the carrying out of vaccination at the public vaccinator's surgery. Under existing legislation, if a child is not vaccinated within four months of birth, a public vaccinator must visit the home and offer to vaccinate the child, after giving 24 hours' notice to the parent. To this matter is appended that of vaccination fees, on which there is a considerable

amount of dissatisfaction as revealed by correspondence received at headquarters. The committee had before it for its information a note on the terms of appointment and the duties of public vaccinators, and a summary of the vaccination fees payable in county areas.

Resolutions from the A.R.M.I.

The committee agreed to pass on to the Ministry of Health and the Board of Education the resolution of the Annual Representative Meeting concerning the importance of developing a correct stance and poise among school children as a basis for healthy adult life. Another matter referred to the committee by the Council on a motion from the A.R.M.I. was the desirability of amending in certain directions the present national superannuation scheme applicable to medical officers in the public health and allied services. The directions in which amendment was sought were the extension of the scheme to include the wives of contributors in order that benefits and pension rights might be continued to the widow on the death of the medical officer, and the reduction of the retiring age from 65 to 60. This matter was referred to the appropriate subcommittee of the Representative Committee with a note to the effect, however, that the Public Health Committee did not approve compulsory retirement at 60. It was its view that such retirement should be optional; it was felt that compulsory retirement at this earlier age would impose considerable hardship on some members of the service.

The extent to which the recommended 20% increase in remuneration as a war-time measure has been granted to medical officers employed part-time by local authorities was considered. A list was given of 46 areas from which replies had been received that the Association's recommendation either entirely or in part had been adopted, but, of course, these represent only a small proportion of the total. It was agreed to recommend the Council to approach the associations of local authorities on the subject. It was mentioned that a number of inquiries had been received as to why the 20% increase had not been recommended for members of the whole-time public health services. The committee had already accepted the view expressed by the Society of Medical Officers of Health that no demand for the revision of salaries should be made at the present time, but that any war bonus awarded to the staffs of local authorities should be extended to all medical officers, whole-time or part-time.

A letter from the Medical Women's Federation was considered which raised the question of the difference in the cost-of-living bonus as between men and women doctors in L.C.C. appointments. It was pointed out that it had always been the policy of the Association that women medical officers should be on the same basis professionally as men, but the differentiation in the cost-of-living bonus

awarded to men and women raised wide issues which extended beyond the sphere of professional activities. It was agreed to reply to the Federation in that sense. While sympathetic towards the Federation's view, the committee considered the matter to be outside professional scope.

The Government Milk Policy

In connexion with the White Paper presented to Parliament in July last on measures to improve the quality of the nation's milk supply, the committee expressed disappointment at certain of the proposals about "accredited" milk and also on some matters of administration. It was pointed out that the production of milk would come under the Ministry of Agriculture, the quality under the Ministry of Food, and the conditions under which it was sold would remain under the medical officer of health. This could lead to nothing but confusion. In the view of the committee it was a Ministry of Health matter. The question was referred to the subcommittee already appointed.

A letter from one Division complained of the trifling fee payable under the Medical Practitioners (Fees) Regulations, 1940, for a patient sent by a midwife to a surgery for examination on the ground of a complication of pregnancy. The committee agreed that all fees in this particular scale were inadequate in certain circumstances, but on the whole they "balanced one another out." With such a scale it was necessary to have a medium figure which would represent the average amount of work. It was not long ago that this matter was thrashed out, when the suggestion that there should be a higher fee for complete antenatal examination was turned down. The committee agreed to reply to the Division that while it considered the fee inadequate, yet, as the matter had been considered so recently, it was felt that the time was not appropriate for raising it again.

Correspondence was reported concerning occasional fees (for vaccinations, attendance at inquests, etc.) received by resident medical officers in municipal hospitals. In some areas these fees are now required to be returned to the employing corporation. The view of the committee was that one specific instance, where an officer had been in the habit of receiving these fees for twenty years without being required to return them, was a case in which the doctor's contention should be supported, but that in the case of new men coming into the service there must be adherence to the terms of the agreement: the conditions should be made clear to them at the time of their appointment.

The committee transacted much other business and gave its opinion on various points submitted with regard to appointments and other matters.

Dr. G. E. St. Clair Stockwell is shortly retiring from his post of school medical officer for Leeds.

GENERAL MEDICAL COUNCIL

The General Medical Council concluded its session on November 25; the session had lasted three days. Most of the time was occupied by disciplinary business.

British Pharmacopoeia Commission

The report of the Pharmacopoeia Commission

to the British Pharmacopoeia Commission, stating that the preparation of a seventh *Addendum*

to the *British Pharmacopoeia*, 1922, had been started. It was hoped that the difficult-

ties arising from the existence of patents in the manufacture of synthetic drugs would

be resolved, and that it would be possible to

include monographs in this *Addendum* which

would cover the field of the sulphonamides

now in general use and would provide stan-

dards for other new drugs. A general mono-

graph on certain biological products and

vegetable drugs would be included. In

drawing up the programme the Commission

had had regard to the twelfth U.S. *Pharma-*

copoeia, and an endeavour would be made

to keep the standards as closely in line with

the new monographs as possible. Good progress

had been made in the preparation of matter

intended for the next complete *Pharma-*

copoeia.

Dr. Campbell added that the Pharma-

copoeia Committee had decided to report

to the Council that in selecting drugs for

inclusion in the *British Pharmacopoeia* the

Commission need not

consider its choice restricted by actual or

potential patent rights in manufacture

DISCIPLINARY BUSINESS

Errata after Convictions of Felony

The Council considered the case of

William Alfred Bevis, registered as of Monk's

Road, Lincoln, who was summoned on the

charge that at Lincoln city assizes in June

last he had been convicted, on his own con-

fession, of unlawfully using an instrument

or some other unknown means to procure

the miscarriage of a certain woman, and

in which he was generally held as an up-

right and honourable man. A committee

was formed locally with a view to getting

up a petition in his favour, and Sir Ralph

Wedgwood presented this petition to the

Council. It bore nearly 3,900 signatures,

including those of the local members of

Parliament, the justice who originally heard

the case at the police court, nine medical

practitioners, and several leaders of religious

life in the district.

Mr. Hempsen pointed out that Dr.

Barrow's actions in this case were certainly

not those of a guilty man. He did not know

how many members of the Council con-

sidered that aloe could be described as a

"noxious thing." Certainly that was un-

known to his client, but when he learned that

the medicine was never paid, but the woman

attempting to procure an abortion. The Pres-

ident had the slightest idea. The woman,

Hempsen replied that neither he nor his

client asked how this came about, and Mr.

being called to give evidence that aloe was

a noxious drug, he, very foolishly, pleaded

guilty not only to supplying the pills but to

the miscarriage of a certain woman, and

in which he was generally held as an up-

right and honourable man. A committee

was formed locally with a view to getting

up a petition in his favour, and Sir Ralph

Wedgwood presented this petition to the

Council. It bore nearly 3,900 signatures,

guilty not only to supplying the pills but to

Certificates without Seeing Patient

The next case was that of William Grant Maule, registered as of Castle Street, Hereford, who was summoned on the charge at on Nov. 16, 23, and 30, 1942, he had ven intermediate N.H.I. certificates to a patient, A. T. Scott, when in fact he had not seen or examined the patient on those dates, nor at all since Nov. 14.

The Council's solicitor stated that the patient in question had an attack of bronchial influenza which kept him away from work for about seven weeks, for four of which weeks he was in bed. He was taken ill on Nov. 7, and Dr. Maule visited him on the following day and gave a certificate. He visited him on two or three occasions, the last being on Nov. 14, and the certificates of later date were given to the patient's wife, who called for them.

Dr. Maule said that he himself was disabled by an accident at the time in question, which accounted for his inability to visit the patient after Nov. 14. But he was convinced on Nov. 14 that the patient was out of danger, and that it was only a question of rest and time. He admitted that he was wrong in giving the certificates, but the certificates were not untrue. It would take the patient three further weeks to get over the attack. Asked how the complaint arose, he said that the patient's wife came to see him, and gave him a good account of her husband's condition, on which he handed her one of the questioned certificates. She then asked him to sign a card of transference to another doctor, who was the doctor for the rest of the family, but he said that this was not necessary, and the next he heard about the case was that there was an inquiry under the National Health Insurance regulations.

The Council found the facts proved, but postponed judgment for twelve months, during which period they trusted that he would take more care in the issue of certificates.

Charges of Embezzlement

The Council considered the case of Humphrey Manley Hamilton Ashwin, registered as of Wilton Street, London, who was summoned on the charge that he had been convicted at Horncastle petty sessions on Sept. 20, 1943, of feloniously and fraudulently embezzling and stealing certain sums (amounting to £48 8s. in the four charges set out) received by him for his employers, Drs. J. V. Buchanan and G. H. Sanderson, and was sentenced to six weeks' imprisonment with hard labour in respect of each offence, the sentences to run consecutively, the sentences being altered on appeal to quarter sessions to three calendar months' imprisonment with hard labour in respect of each offence, the sentences to run concurrently. Dr. Ashwin was also charged with having been found guilty by a court-martial at Cardiff in April, 1942, of conduct to the breach of good order and military discipline by giving cheques which were not honoured when presented, when he was sentenced to be cashiered.

Dr. Ashwin did not appear before the Council, nor was he represented. It was stated that he had been a locum tenens in a medical partnership at a salary of £750, plus certain fees and a house. A patient who had had an account rendered to him went to see Dr. Buchanan and said that the bill had already been paid. Dr. Ashwin, on being questioned, said that by an oversight he had paid the amount into his own account. Further inquiries were made, and it was discovered that he had failed to account for a much larger sum. At the trial he had pleaded guilty, but declared that while he had been grossly negligent he had not been criminally so.

The Council instructed the Registrar to erase Dr. Ashwin's name from the Register.

Misdemeanours

The Council further considered the case of Hugh McNicholl, registered as of High Road, Mottingham, S.E., who had been found, at the Council's session in Nov. 1942, to have been convicted on two occasions (in 1939 and 1942) of driving a motor-car while under the influence of drink. He now appeared with a number of testimonials to his good conduct in the interval, and the Council dismissed the complaint against him.

The case was considered of Ewen Lovat Fraser, registered as of Paisley, against whom it was charged that he had been convicted at West Sussex quarter sessions in September last of driving a motor vehicle whilst under the influence of drink, and had been fined £100 and 25 guineas costs, and his licence suspended for life. It was stated that Dr. Fraser had been previously before the Council for a like offence in May, 1939. The Council found the conviction proved, but suspended judgment for two years—until the November session, 1945.

In the case of Robert Frederick Martin Trimble, registered as of Stacksteads, Bacup, who was summoned in respect of three convictions, two in 1938 of being drunk, and one in 1940 of being in charge of a motor vehicle while under the influence of drink, and whose case had been postponed on two previous occasions in his absence, Mr. Fortune, his counsel, stated that Dr. Trimble was serving in the Merchant Navy, where he had been for three years, and incidentally was severely wounded in Crete. He gave an explanation of the occurrences, and the Council dismissed the complaint.

Alleged Professional Relationship in Adultery

The Council considered the case of Joshua Posner, registered as of Hyde Park Road, Leeds, who, by decree of the Divorce Division, had been found guilty of adultery in the case of McNulty v. McNulty and Posner, in which he was co-respondent, and against whom it was alleged that at all material times he had stood in professional relationship with the respondent or with her husband or with both of them.

Dr. Posner was represented by Mr. Oswald Hempson, solicitor.

The Council's solicitor put in a transcript from the shorthand note taken in the Divorce Court, in which the husband, Barnard Gordon McNulty, stated, after giving an account of his wife's association with Dr. Posner, that he himself was examined by the doctor, representing an insurance company, when he took out an endowment policy in 1938, and that Dr. Posner attended him for a leg injury, and afterwards became, "in a mild sort of way," a friend of the family. In 1939 his wife was ill and Dr. Posner said that she might need an operation and asked to be given authority to have the operation performed. He thought that Dr. Posner did not actually perform the operation, but he saw her in the nursing home and acted as her medical adviser. In consequence of a letter received from his wife in 1941 he asked both Dr. Posner and her whether they had committed adultery, which they denied.

A statutory declaration from the secretary of a nursing home was put in stating that Mrs. McNulty was admitted to the home by Mr. Bryan Jeaffreson, with whom Dr. Posner's name was coupled, and she assumed that Dr. Posner was the patient's general practitioner. She did not think he gave the anaesthetic.

Dr. Posner, in evidence, said that he first met Mrs. McNulty in 1934, but did not know until 1937 that she was married, nor did he know when he first attended Mr. McNulty that he was her husband. In 1939 when Mrs. McNulty became unwell he refused to treat her and suggested another doctor. He was asked to give the anaesthetic at the operation, but refused to do so. He merely visited her as a friend, and he never discussed her case with Mr. Jeaffreson. The divorce damages were agreed at £500 on condition that the fact that he was a medical man was not mentioned in the proceedings.

Confirmatory evidence was given by Mrs. McNulty and by her mother, and a statutory declaration by Mr. B. L. Jeaffreson of Leeds was put in, stating that although Dr. Posner arranged an appointment for him to see Mrs. McNulty he took no active part in the consultation and no part in the operation or after-attendance.

The Council found that adultery was admitted, but that the charge that at all material times Dr. Posner had stood in professional relationship with Mrs. McNulty or her husband or both of them had not been proved, and therefore dismissed the case.

Erasure under Section 26 of Medical Act

The Council considered a report from its Executive Committee on the question of whether it should, in pursuance of Section 26 of the Medical Act, 1858, which empowers the Council to direct the erasure of a name which has been registered on incorrect information, erase from the Medical Register the entry made therein on Feb. 9, 1942, in respect of Mrs. Astrid Hill, M.D.U.Oslo, 1922, under Defence Regulation 32B and the Medical Register (Temporary Registration) Order (No. 2), 1941. After consideration of the report the Council directed that the name be erased.

Restorations

After a session *in camera* the President announced that the following names had been restored to the Medical Register: Christopher Bastible, Dominic Francis Curran, Richard Christopher Howard, Arthur John Ireland, Charles Liddell McHarg, Antony Alexander Martin, and George Anderson Mitchell.

Other Business

A report by the Education and Examination Committees was presented. It dealt only with the qualifying examinations which have recently been inspected on behalf of the Council, and reported the receipt of observations on behalf of the licensing bodies on previous reports.

The Council considered *in camera* a report from the Executive Committee on the proceedings at a deputation from the Council received by Ministers on June 30 concerning the proposed establishment of a register of specialists, and on subsequent action.

Messrs. Waterhouse and Co. were re-appointed solicitors to the Council for another year.

Men invalided from the Services who are not entitled to a pension but who are admitted for treatment of their disability to an E.M.S. hospital are to be a charge on the Exchequer until treatment is complete or for six months from the date of discharge, whichever is the shorter. Should a patient need further treatment at the end of the six months he should be transferred to a hospital in his home area, when he will become a "civil" responsibility outside the E.M.S. scheme.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 18 1943

DEALING WITH THE INFLUENZA EPIDEMIC

It was briefly announced last week (*Journal*, 768). Service medical officers are to be allowed, so far as their military duties permit, to help civilian doctors during the present influenza epidemic. It has not yet been decided not to call up doctors from the Forces during the next few weeks, though the Central Medical War Committee will continue to issue recruitment notices, and medical examinations and interviews will take place in the usual way.

In a letter to all medical officers of health Sir Wilson Jameson suggests the following procedure for getting the help of Army medical officers. First there would be a meeting of the secretary of the Local Medical War Committee, the county medical officer of health (who would take the initiative immediately in calling this meeting), and the appropriate A.D.M.S., to decide the arrangements most suitable to the area. General practitioners and factory doctors needing help should apply to the secretary of the Local Medical War Committee, stating whether the help is wanted for visits or on the surgery, and the secretary, if satisfied with the claim, will pass it to the A.D.M.S., either through the M.O.H. or, as may be decided locally, direct to the military medical unit in the area. Arrangements for obtaining similar help from medical officers of the R.N. or R.A.F. are not yet completed, but medical officers of health will be informed of any in due course.

The Ministry of Health has also circulated local authorities on the domestic and nursing help they can give to households and the provision of meals from British Restaurants and school canteens. The maternity and child welfare authorities should use to the full the powers they have to provide home helps, while local organizations, both municipal—first-aid posts and rest centres—and voluntary, may be able and willing to supply volunteers. Health visitors and school nurses may also be able to help. The Ministry of Food and the Board of Education have agreed to provide meals from British Restaurants and school canteens, but the extent to which this can be done will depend on the facilities at the canteens themselves. These arrangements for nursing help, etc., will, of course, vary from place to place, but doctors and nurses will no doubt be informed direct by the medical officer of health, or, where applicable, by general local publicity, of those that have been made for their areas. These suggestions, states the circular, are not exclusive; the local authority may be able to make others; but the important thing is to see that everything possible is done to lessen the difficulties inherent in wartime in an epidemic which, "though not virulent in type," is having serious repercussions on war production.

DISCUSSIONS IN THE SERVICES Army Council's Decision

The following letter, which has just been received by the Secretary of the B.M.A., contains the Army Council's permission, subject to certain conditions, for medical officers to take part in organized discussions on the future health services.

The War Office, London, S.W.1.
December 11, 1943.

Sir,

1. I am commanded by the Army Council to inform you that from time to time the guidance of this Department has been sought by administrative medical officers at home and over-seas as to the extent to which Service medical officers may participate in organized discussions and express opinion, both individually and collectively, on the Government's proposals for the reorganization of the civilian health services, which will be outlined in a White Paper shortly to be issued.

2. The Army Council have carefully considered this matter, and have agreed that, subject to the exigencies of the Service and to a clear understanding that such discussions are conducted in off-duty hours, and that Service channels of communication are used neither to promote meetings nor to transmit the opinions of individuals or groups of medical officers, there is not only no objection to but every justification for such discussions being held.

3. I am to inform you that Commanders-in-Chief and General Officers Commanding-in-Chief, both at home and over-seas, have been instructed accordingly, and it is thought that you will wish to know of this decision by the Army Council at the earliest opportunity.

(Sgd.) G. W. LAMBERT.

INSURANCE ACTS COMMITTEE ACTION ON PANEL CONFERENCE RESOLUTIONS

The first meeting of the newly elected Insurance Acts Committee was held on Dec. 2. Dr. E. A. GREGG was unanimously re-elected to the chair. The committee expressed its great appreciation of the work of Dr. D. G. Greenfield, who, after membership of the committee extending over 21 years, did not seek re-election. The executive committee and various subcommittees were reappointed with slight variations of personnel.

Capitation Fee Claim

The Deputy Secretary (Dr. Hill) reported that since the Ministry's letter of Oct. 21 agreeing to a wartime bonus corresponding to the scale for civil servants earning between £500 and £850, the bonus of £25 payable to such civil servants had been doubled, and it was understood that pressure was being brought to bear for the bonus to be extended to those earning above £850. The doubling of the civil service bonus for this group would have the effect of doubling the amount to which practi-

tioners would be entitled under the arrangement the Ministry suggested.

It was agreed to ask the executive committee to revise and to re-present the case to the new Minister of Health for an increase in the capitation fee based on wartime conditions.

A letter was considered from one of the Group standing committees asking the Insurance Acts Committee to state what in its opinion would constitute an adequate capitation fee. The chairman said that an answer might be given by recalling first the figures referred to in previous discussions. At the last Court of Inquiry in 1937 a sum of 12s. 6d. was mentioned as likely to be acceptable, but that, of course, was before the recent economic changes, and in particular before the inclusion of insured persons with incomes up to £420. The increased responsibility, the wider scope of practice, the longer time spent with the individual patient, were all factors to be taken into account, as well as the rise in the cost of living and in practice expenses. In any reply on this point it should also be made plain that in view of the late Minister's assurance that the basic capitation fee would be investigated "from the ground floor" after the war, the committee had not felt the time opportune to enter into the whole question of the basic fee while it was engaged in so many other important tasks.

Present Increase in Sickness

Attention was drawn to a statement in the last Summary Report of the Ministry of Health suggesting that crowded consulting rooms did not necessarily imply an increase in the amount of illness, and that while there appeared to be more visits to surgeries there were fewer visits by doctors to patients' homes. It was asked how the Ministry could know the ratio of attendances to visits. One member suggested that it was time that some protest was made to the Ministry concerning official statements which tended to minimize the prevailing amount of illness and the consequent heavy burden thrown on the medical profession. It was difficult to understand the Ministry's statement that the illness from which many people were now suffering was not the real "flu" virus. It was agreed that some representations should be made to the Ministry.

Comprehensive Medical Service

The committee then turned to the resolutions passed at the recent Annual Panel Conference on the subject of a comprehensive medical service. It was agreed to communicate to the Council of the Association, with the endorsement of the whole committee, a resolution passed at the instance of the Isle of Wight:

"That in all future discussions with the Ministry on a comprehensive national medical service insurance practitioners as such shall be directly

The chairman said that he would especially emphasize this in his report to the Council. Other resolutions of the Conference similarly approved for submission to the Council were those urging the Government to delay the inception of a service until sufficient medical manpower was available to operate it efficiently; calling for adequate representation of the rural practitioner on the Representative Committee; expressing the view that if the service was to be operated by a two-way extension of National Health Insurance there should be a substantial increase in the capitalization; and declaring that the family doctor should be the pivot of any future system, with hospitalists in which he could himself conduct examination and treatment or remain in touch with the patient if he placed him under the care of a specialist.

Medical Treatment of Discharged Personnel

Correspondence with the Ministry of Health on the medical treatment of members of the Forces discharged on medical grounds was placed before the committee, concluding with the transmission to the Ministry of the resolution of the Conference noting with satisfaction that the Ministry was prepared to agree on a special fee of 16s. 6d. for these cases, and recording the opinion that any such special fee should be regarded as the basic capitation fee in being, plus a percentage thereof.

The resolutions of the Conference under this heading were also considered, including those on improvements in Group organization, the presentation of medical views in Parliament, and the allocation of more space in the *Journal* to medico-political matter. On this point the Chairman of Council (Dr. Dain) said that the end to secure was greater elasticity as between the claims of clinical and scientific matter and medico-political matter on *Journal* space, and every effort would be made to ensure that ample space was available on occasions such as Representative Meetings to give a full presentation of the views expressed. On the question of the presentation of medical views in Parliament, it was agreed to request the new Public Relations Committee to draw up a detailed plan.

Certain other resolutions of the Conference concerning improvements in administration of National Health Insurance were noted for bringing before the Ministry at the next interview.

A member of the committee urged that steps be taken to allocate the floating insured population, especially those on camp sites, to practitioners. He said that in his own area these people came to the nearest doctor in their locality only when they were ill, and therefore the capitation system under which the doctor was paid for the family as well as for the sick broke down at all events locally, whatever might happen in the case of the national fund. He suggested that some prominent people should be given to these people to place their medical cards with the doctor of their choice. Various members of

The chairman said that one method would be for Panel Committees to instruct their secretaries to communicate with welfare officers and others on the subject. It was agreed that the attention of Panel Committees be drawn to this course.

received from one Group Committee was an expression of dissatisfaction with the failure of the Insurance Acts Committee to bring about an improvement in regard to the closing hours of pharmacists' shops. The chairman said that in London they had succeeded in getting the Pharmaceutical Committee to institute an inquiry concerning pharmacists' establishments, and now a rota of open pharmacies had been established in London and was being extended. It was also stated that in Liverpool (except in one area, where there was a rota) a scheme had been arranged whereby every

and, as was not, it is in each locality, to take steps to instil a sense of responsibility in the community. The Ministry of Health is aware of the importance of the role of the community in the development of the health service and is taking steps to ensure that the community is fully involved in the planning and implementation of the health service. The Ministry is also aware of the importance of the role of the community in the development of the health service and is taking steps to ensure that the community is fully involved in the planning and implementation of the health service.

A communication was received from one Group Committee urging that an endeavour be made to arrange that all members of the Seamen's National Insurance Society be placed in the same position as all other insured persons. It was agreed to draw the attention of the Ministry to the anomalous administration of the society in this respect.

Correspondence

Panel Committees.

tributions was considered; nevertheless, the trustees thought favourably of the proposal, and referred it to the executive committee to put up a definite scheme which, after approval, might be sent to

It is essential in any scheme for an interested G.P. to acquire further knowledge in any part of medicine, and to have the opportunity to put that knowledge into practice. Refreshment courses have a limited benefit. The younger G.P.s should be assured that after the scheme had started all future specialists would graduate from the ranks, while the older G.P.s, who had not made such an impressive beginning in their careers, could still hope for promotion—a possibility, not, however, attached to the number of years spent in the profession.

Woodford Green, Essex.
- G. FOSTER SMITH.

The most important criticism of the present system is that most patients do not get ideal treatment for the following reasons:

1. The G.P. is overworked. The sovereign remedy here must be the removal of the causes of ill-health. Every suffering from preventable diseases. The answer is in the hands of Parliament, advised, if the Aylesbury Plan be adopted, by the national board of health. Lesser remedies, of some interim value, are to increase the number of doctors; to relieve the doctors of a lot of work which could equally well be done by nurses, dispensers, and secretaries; and to increase collaboration.

2. The G.P. is out of date. This is frequently true, not because he is intellectually incapable of remaining up to date but because he is overworked with his colleagues, and frequents hospitals so seldom. If his work were reduced he would be able to treat effectively many patients whom he now sends to hospital only because he hasn't time for them. He could form and join clinical societies and he could follow his patients into

The most important criticism of the present system is that most patients do not get ideal treatment for the following reasons:

1. The G.P. is overworked. The sovereign remedy here must be the removal of the causes of ill-health. Every suffering from preventable diseases. The answer is in the hands of Parliament, advised, if the Aylesbury Plan be adopted, by the national board of health. Lesser remedies, of some interim value, are to increase the number of doctors; to relieve the doctors of a lot of work which could equally well be done by nurses, dispensers, and secretaries; and to increase collaboration.

2. The G.P. is out of date. This is frequently true, not because he is intellectually incapable of remaining up to date but because he is overworked with his colleagues, and frequents hospitals so seldom. If his work were reduced he would be able to treat effectively many patients whom he now sends to hospital only because he hasn't time for them. He could form and join clinical societies and he could follow his patients into

hospital. He could keep his interest in scientific medicine alive. As it is, in the words of P.E.P., "excessive numbers of panel patients and excessive demands for certificates and returns of one kind and another quickly reduce the G.P. to an agent for making out prescriptions for mere palliatives and for operating something more like a sickness licensing and registration system than a health service." This is true. I did it for seven years.

3. The G.P. is too jealous of his colleagues to collaborate with them. This also is too often true. A very efficient young doctor I know was sacked by his chief because he was seen discussing an interesting case with a member of the rival firm. This is an extreme example, but lesser examples abound. Behind this jealousy, rationalized in a thousand ways, lies fear. It would be interesting to know what proportion of those who have had to buy their practices are out of debt at 40. Many are in the hands of money-lenders (often called insurance companies) all their lives.

The makers of the Aylesbury Plan believe that these conditions can only be cured by a form of group practice, preferably conducted from a health centre, which would not be the robot institution of the diseased imagination of many critics, but a convenient common surgery equipped with all the necessary tools of the trade, with individual consulting rooms, a dispensary, a dispenser, a nurse, and a secretary. The centre would be run by the doctors using it, but the expenses would be paid by the regional council, which would thus have a light control over its efficiency—a necessary safeguard. The G.P.s would take over again the functions which have been taken from them by the local authorities—the care of maternity and child welfare and of patients suffering from tuberculosis, venereal diseases, and infectious conditions.

Many of these health centres would be run in conjunction with Grade III hospitals, staffed by the local G.P.s. The district nursing service would have its headquarters there. Specialists would visit them when required from the larger hospitals. The doctors staffing the centres could have a rota for night work if they so desired, or they could carry on exactly as they do to-day. It would be for them to decide. There would be no interference with them from above if they ran the show well. With such close collaboration it would be easy to arrange holidays, absences on postgraduate courses, and perhaps regular afternoons in the nearest Grade I or Grade II hospitals. It would be easier, too, for a keen man to develop his own specialty, and ultimately to become a part-time assistant in the local Grade II hospital. Thence, if he desired it, could come a transference to whole-time specialist service. It would be an understood thing that G.P.s would be welcome in hospitals of all grades, though obviously the responsibility for the treatment of patients must remain with the man on the spot.

As Dr. Foster Smith says, methods of remuneration are not all, but they are important. In the Aylesbury Plan a G.P. receives: (a) a basic salary dependent upon his qualifications; (b) a yearly increment; (c) a capitation fee for each patient on his list, for to deny the inspiration of money is idealistic claptrap; and (d) a salary for any additional part-time work, such as assistant in a Grade II hospital.

General practice can no longer be entirely uncontrolled. Lack of control has in the past led too often to inefficiency. The control must, however, be light or the spirit will leave the body of medicine. The regional councils will contain G.P.s elected by G.P.s. The general practice advisory council will consist of G.P.s elected by G.P.s, and its chairman, a G.P., will be a member of the national board of health. The power which controls the G.P., so lightly that the rein can hardly be felt, will be a democratic power, held by himself, and not by an anonymous civil servant.—I am, etc.,

Whitchurch, Bucks. RAYMOND GREENE.

Misleading Opinion

SIR.—The four signatories of the letter in the *Supplement* of Dec. 4 (p. 93) contend that the B.M.A. is not "anti-Beveridge." May I advance some arguments which in my submission indicate that the contention is untenable?

The Beveridge plans depend, according to the author's reiterated declarations both in the report and in public speeches, on the fulfilment of, among other items, his Assumption B, which demands the establishment of a full-time salaried medical service covering 100% of the population and therefore involving, as the author admits, the ultimate extinction of private practice, "for which the scope will be so restricted as to make it not worth while retaining."

The constitution of the B.M.A. requires by the Articles of Association that its official policy shall follow resolutions adopted by its Representative Body (even though the Council may disagree with these), just as in our national system of Government the Cabinet must either obey the dictates of Parliament or resign their office. Ten weeks ago the Representative Body, at a meeting which assembled seven-eighths of the entire body of Representatives entitled to vote, passed a resolution by 200 to 10 votes, expressing opposition to the creation of a "full-time salaried State Medical Service." I submit that that resolution is wholly incompatible with the Beveridge scheme for medical services; *ergo* the B.M.A. must be anti-Beveridge. Q.E.D.—I am, etc.,

E. GRAHAM-LITTLE.

** Sir Ernest Graham-Little is, of course, entitled to his opinion, but it is not generally accepted that Assumption B demands the establishment of a full-time salaried service. Indeed, Sir William Beveridge made it clear that he had no recommendations to make on the form the comprehensive service should take.—Ed., B.M.J.

B.M.A. Policy: Misunderstanding

SIR.—Dr. J. Vaughan Jones's reply to a letter from Dr. L. G. Allen (*Supplement*, Nov. 27, p. 91) explains his position, but will not remove misgiving. No one will dispute the right to hold personal opinions, but whether it is wise in the present crisis for those in high office to "express them vigorously" is open to doubt. Such action will not advance the Association's policy, and is sure to embarrass the work of the Public Relations Committee.

On the principle of free choice the profession has come nearer to unanimity than on any other question. All the eleven bodies constituting the Medical

Planning Commission recommended free choice (*Supplement*, Jan. 2 last) and the principle was approved by the Annual Representative Meeting by a very large majority.

Once a decision has been come to on a vital question of policy are we not entitled to expect the co-operation of all members? Dr. Vaughan Jones says that from him the official policy of the Association will always receive the proper emphasis. What is the proper emphasis?

—I am, etc.,
Sheffield.

HENRY BROWN.

Locumtenents' Fees

SIR.—Since no one so far has replied to the letter on this subject (*Supplement*, Nov. 6, p. 91) I have decided to do so. Having been an assistant, had my own practice and employed locums, retired, and returned to work on the outbreak of war, I am able to see all sides, except that I write solely of rural practice conditions. I think the point has been missed that the locum retains only half or even less of what he is paid, for he has either to leave his wife at home with the expense of keeping the house open or else pay someone to attend to certain minor matters. With regard to hospitality to a wife, my case is perhaps unusual, since my wife, being qualified, and I work together with the consent of the principal, which has never been withheld. Two guineas a week has at times been deducted, but I do not think that it really costs as much as that to keep a woman, even if she has the most voracious appetite.

There is another side to the matter. Time was when the locum had only to deal with the patients. He was driven by a man who knew everyone; now a locum is expected to drive himself and find his way in a strange country. All names are foreign to him and often not pronounced as spelt. Also he had better be a mechanic; there are often two cars in a practice, and the principal does not give the locum the better. I don't blame him. Sometimes he is asked to drive his own car. This has advantages, but the usual allowance is £1 a week, and at present prices this covers only a very limited mileage. Further if the locum should be so unlucky as to have an accident he may be without his car for months and the cost of repairs may swamp more than he has earned. Work in a strange place is always hard and at times the organization is not too good—ointments at one end of the surgery, the boxes at the other, labels kept loose in a box, and N.H.I. records in a dark corner. Doubtless the principal prefers things so, but it makes hard work for his deputy.

The wartime assistant or locum-in-charge is a bit better off, since he has more continuity of work. A furnished house is often provided. There is practically no hope that he will get a servant. This means that his wife and he will have to do the housework, look after the car and (if they want vegetables, and who doesn't?) the garden as well. To some, and I include myself, this may not be an insuperable hardship, but it should be taken into account in estimating fees. Again, I don't for a moment blame the principal; he is quite powerless to do anything about it. A month's work at twelve guineas a week brings in about £25. One way and another this may well work out at nearer £20. In peacetime,

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 25 1943

BRITISH MEDICAL ASSOCIATION PROCEEDINGS OF COUNCIL

A meeting of the Council of the Association was held at B.M.A. House, London, on Dec. 15. Dr. H. G. Dain, Chairman of Council, presided, and forty-two members were present.

The deaths of three former members of Council were reported—namely, Dr. William Calwell (Belfast), Dr. R. B. Mahon (Dublin), and Sir William Wheeler—and the Chairman was authorized to send a letter of condolence to their families.

The Council sent a message of warm regard to its Secretary (Dr. G. C. Anderson) in his illness, with the hope for his speedy recovery. It also received with gratification a letter from the President of the Royal College of Surgeons of England conveying the sympathy of the Council of that body. The letter went on: "His illness at this particular time is deeply deplored; and his services on behalf of the profession have been so highly valued that we realize how ill we can spare his wise counsel and guidance."

What was held to be an unsatisfactory reply was reported from the Ministry of Labour and National Service on the subject of doctors' maids, following a letter from the Association conveying the resolution passed at the Annual Representative Meeting. The reply promised sympathetic consideration of difficulties arising in individual cases, but the policy of the Department was "not to issue compulsory directions to take up domestic employment in private households, among which doctors' households are included." The Council took the view that there should be power to "direct" women labour to doctors' households, and instructed the General Practice Committee to follow up the matter with the Ministry.

Ethical Procedure

Dr. N. E. Waterfield, for the Central Ethical Committee, said that a recent dispute between a general practitioner and the local medical officer of health had brought forward the question whether, in cases in which his committee acted as a court of first instance, there should be a body set up to which an appeal from its decision could be made. A resolution, some thirty years old, made the Central Ethical Committee the final court of appeal against a decision of a Branch Council, but no opportunity was given for appeal in a case in which the committee itself made the first investigation (and there might well be cases in which for good and sufficient reasons the inquiry ought to be taken out of the local atmosphere and be made directly by the committee). Therefore it was recommended that an appeal from a decision of the committee should be allowed on certain specific grounds, and that for this purpose there should be set up an appellate tribunal consisting of experi-

enced members of the Association, not necessarily members of Council, but preferably former members of the Central Ethical Committee, and that they should serve by rota to constitute a court of three.

Dr. J. A. Ireland and other members expressed the view that the better course would be to avoid allowing the Central Ethical Committee ever to be a court of first instance, and that many local units of the Association would resent having the ethical procedure taken out of their hands. Mr. A. M. A. Moore thought that the local ethical committee should be the first court, strengthened possibly by an independent representative from headquarters. Dr. Waterfield pointed out that the new procedure now recommended would be called for only in exceptional cases.

After further discussion it was agreed to ask the Central Ethical Committee to reconsider the matter, particularly in view of the possibility that the committee itself might in some instances initiate as well as investigate a complaint.

Election of Vice-Presidents

The Council unanimously agreed to recommend to the Representative Body the election of the following as Vice-Presidents in view of exceptional services rendered to the Association: Mr. W. McAdam Eccles, Mr. N. Bishop Harman, Dr. R. G. McGowan, and Mr. H. S. Souttar. In bringing forward the proposal the Chairman said that in the case of Mr. Eccles, Mr. Harman, and Mr. Souttar the Council was already familiar with their outstanding services in their midst, but Dr. McGowan was not and never had been a member of the Council, and therefore he called upon Prof. A. H. Burgess, as a fellow Mancunian, to speak of his exceptional work in Lancashire. Prof. Burgess said that as long ago as 1902 when the Association changed its constitution Dr. McGowan was appointed honorary secretary of the Manchester Division, and he had remained so until last year, when he was appointed chairman. He was the first honorary secretary of the Panel Committee, and that position also he held until he became its chairman last year. He was the first and only chairman of the Local Medical War Committee; on the Insurance Acts Committee he had been a direct representative for ten years; he was honorary local secretary for the B.M.A. meeting in Manchester in 1929; and he was the representative of general practitioners on the joint hospital committee in Manchester. The Chairman said that the recognition proposed would be a very proper one in view of such a record.

The Forthcoming White Paper

A resolution from the Harrogate Division called for a précis of the present position regarding the future of medical services as reflected in the discussions

with the Ministry of Health to be forwarded to all Service members, and asked that the proposed questionnaire and analysis of the White Paper should not be sent out to members of the profession until 60% of the Service members had answered showing that they had received the précis.

The Deputy Secretary (Dr. Charles Hill) said that as soon as the Government White Paper was published an analysis would be prepared in relation to the principles already adopted by the Association, and would be submitted to a meeting of the Council. In the meanwhile the questionnaire would be in preparation. There would be issued to all members of the profession, whether in the Services or in civil practice, and whether members of the Association or not, an analysis of the White Paper and a questionnaire prepared by an independent expert body, the British Institute of Public Opinion.

The Chairman said that in many areas members in the Services were actively discussing this question. Service people were by no means shut off from what was happening. Prof. R. M. F. Picken endorsed this, but said that there was one group—namely, prisoners of war—which needed special consideration, for he understood that they did not always receive the *Journal*. The Chairman mentioned that it was intended to issue regularly from the office a letter to medical prisoners of war on these subjects.

It was agreed that a statement of the present position—prefaced by a brief historical note—should be sent in advance to doctors serving over-seas, but it was understood that if the White Paper appeared before this work could be completed, the work should be waived in favour of the analysis and questionnaire which it was proposed to issue to all members of the profession.

The Council also approved an estimate from the British Institute of Public Opinion for preparing the questionnaire and checking, tabulating, and assessing the replies. It was understood that the interval between publication of the White Paper and dispatch of the ballots would not exceed three weeks.

General Practice

Dr. S. Wand presented the report of the General Practice Committee. It covered the period from Nov. 20, 1942, to Nov. 20, 1943. The Council adopted a recommendation on the employment of pregnant women in factories: that each case must be decided after careful consideration of all the factors; that ordinary factory work is usually inadvisable during the last six or eight weeks of pregnancy; that a careful examination should always be carried out before a woman returns to work, preferably at the end of the six weeks following confinement; and that it is desirable that it should be made economically possible for a woman employed in industry to breast-feed her child.

Attention was drawn to the representation made by the committee for an increase in the capitation fee of Post Office medical officers. Dr. Ireland said that it was felt in his area that any arrangement now made with regard to the treatment of Post Office servants and porters, but it was such a small item in the whole scale that it seemed rather out of proportion to raise it now. Dr. Ross, Dr. J. B. Miller said that the fee of 2s. 6d., if taken alone, could not be supported, but it was such a small item in the whole scale that it seemed rather out of proportion to raise it now. Dr. Ross, Dr. Ireland, and Mr. A. S. Gough supported the motion to refer back.

National Health Insurance

Dr. E. A. Gregg, presenting the report of the Insurance Acts Committee (which covered ground set out in the report of the meeting of the committee in the Supplement of Dec. 18), drew attention to the resolutions passed by the Annual Panel Conference on a comprehensive medical service, in particular one which said that in all future discussions with the Ministry on this subject insurance practitioners, as such, should be directly represented on the negotiating committee through representatives elected to that committee by the I.A.C. or the Panel Conference. The Chairman said that the procedure would be for the Council to accept from the I.A.C. the nomination of a proportion of members of the negotiating committee. It could not be facilitated—namely, that persons nominated for the negotiating committee should be elected or approved principles adopted at the Representative Meeting. The Chairman said that the Representative Body having adopted this series of resolutions, he saw nothing preposterous in asking people who were proposed as future negotiators to declare whether they approved the principles or not.

Public Health

Prof. Picken presented the report of the Public Health Committee. The various matters in this report appeared in the Supplement of Dec. 11. It seemed to the committee that the present opportunity should be taken of entering into discussions on the payment of practitioners employed part-time by local authorities, and accordingly it proposed that the associations representing local authorities in England and Wales be invited to discuss as a wartime measure an increase of 20% in such pay. This proposal was approved by the Council, and the Chairman of Council and the chairmen of the Public Health, Insurance, Hospitals, and General Practice Committees were appointed to represent the Association in these discussions. A letter from the Wandsworth Division expressed concern at the inadequacy of the fee of 2s. 6d. payable under the Medical Practitioners (Fees) Regulations, 1940, when a patient with a complication of pregnancy was sent by a midwife to a doctor's surgery for examination. Prof. Picken said that it was only in 1940 that the Association obtained considerable increases in the scale of fees payable to doctors called in by midwives, and the Public Health Committee did not think the time opportune for further amendment of the scale. Dr. Wand main-

tained, on the contrary, that the time was never more opportune, and he moved that this matter be referred back to the committee for further consideration. Dr. J. B. Miller said that the fee of 2s. 6d., if taken alone, could not be supported, but it was such a small item in the whole scale that it seemed rather out of proportion to raise it now. Dr. Ross, Dr. Ireland, and Mr. A. S. Gough supported the motion to refer back.

Prof. Picken maintained that the time was inopportune because this was one small item in a scale of fees which had been the subject of prolonged negotiation at the Ministry of Health between the associations of local authorities and the B.M.A. It was not a fee for a complete ante-natal examination. The scale made no provision for such a fee, and to open up the whole question on this one little point seemed futile. If members thought the whole scale inadequate, that was another matter and they should say so. The question of vaccination fees had also been raised, and after discussion with the representatives of public vaccinators it had been agreed to press for the 20% increase. Dr. Wand said that the Ministry of Supply had recognized a 3s. 6d. fee for consultation at the doctor's surgery; this was higher than the fee now under discussion, even if that fee was subject to 20% increase.

The motion to refer back this paragraph was carried, and it was also agreed to ask the Public Health Committee to advise the Council whether fresh approaches should be made to apply the 20% increase to the fees under the Medical Practitioners (Fees) Regulations, 1940.

Medical Services in Scotland

Dr. G. MacFarquhar brought forward a report of the Scottish Committee. He said that the committee had devoted some time to a draft memorandum on the amendment of the terms of service of practitioners under the Maternity Services (Scotland) Act, 1937, and this had been submitted to the Department of Health. He also referred to the supply of menial medical service, which, originally starting on Clydeside, had now been extended to all the industrial areas of Scotland to cover workers of all ages. Since the service was inaugurated in January, 1942, 3,758 persons had been examined under this scheme, and of these 1,573 had been admitted to a hospital or convalescent home under the Emergency Hospital Scheme. The service was established to help young people who had been called up for work in connexion with the war effort and were not standing the strain very well. It provided for expert examination and, where necessary, for hospital and convalescent treatment.

Questions were asked by various members of Council concerning this last arrangement, to which Dr. J. B. Miller and Dr. I. D. Grant replied. It was explained that if a doctor had some case which for one reason or another he did not feel justified in sending to hospital he could apply under this scheme to the regional medical officer to have the case investigated at an E.M.S. hospital. Some members of Council were interested in the function of the regional medical officer in this matter. Dr. Grant said that the R.M.O. acted solely as a filter. It was agreed to ask the Scottish Committee to furnish a statement on this service to the Insurance Acts Committee.

Prof. Burgess, as chairman of the Special Practice Committee, brought forward two recommendations from the Physical Medicine Group Committee. One was that steps be taken to bring to the notice of the Cabinet Corporation making commissioned rank open to male and other physiotherapists serving in H.M. Forces. The resolution of it was accompanied by a memorandum which stated that at present physiotherapist in the Services could not rise to higher rank than sergeant, whereas nurses held commissioned rank, as did orthopodists in the R.A.F., though it had a much shorter training period and their standard of training was not high, particularly in the basic sciences. Major-General R. W. Leslie said that commissioned rank was given not on account of professional status but administrative responsibility. In fact only a very small and selected nursing personnel who were in charge of war field commissioned rank, and they were not officers of the R.A.M.C. Sir Victor Richardson explained the special circumstances under which a very small number of trained orthopodists had been given rank in the W.A.A.F., not in the medical branch of the R.A.F.

It was agreed to remit this matter to the Special Practice Committee for consideration; so far the Committee had merely passed on the Group Corporation's proposal. Another recommendation from the Group—to make representations to the Ministry of Health for supply for delivery of valves for short-wave apparatus—was endorsed by the Council.

Women on the Council

Mr. A. M. A. Moore raised the question of the representation of women on the Council. The Council made decision affecting women practitioners, and yet a woman was a member of its body. It had in mind that the women members of the Association should elect two members of Council. Mr. Zachary Cope, in urgent consideration of this question, said that there were ten men to one woman on the *Medical Register*, and therefore would be difficult under any scheme open general election to secure representation in favour of some special arrangement. Dr. C. J. Stevenson and Dr. Peter Macdonald spoke in favour of some special arrangement to ensure the representation of women.

Dr. S. Wand moved to ask the Organization Committee to consider favourably some method whereby the women members of the Association might elect two of their number on the Council, and this was agreed to.

Home Guard Buries

Dr. J. G. Thwaites moved:

That, in view of the increasing incidence and incidence of minor illness among the people, the Government be pressed to relax to the greatest possible extent competition with safety the severity of Home Guard duties, and in particular to stop all but strictly necessary night guard duty.

He had talked with reasonable and intelligent members of the Home Guard who were his patients and who had expressed the view that a number of Home Guard duties were unnecessary. Mr. H. J. McCurtich, in seconding, said that Home

PROCEEDINGS OF COUNCIL

DEC. 25, 1943

duties could be divided into those due to essential security and those due to a training nature. On the one hand, some commanding officers there were a zeal for unnecessary parades, and a majority feeling of the Council that this was not a question on which could put forward an opinion in view of circumstances relating to the public which could not be fully revealed, a motion to proceed to the next business was adopted.

Treatment by Service Officers

r. McCurich moved:

that the medical officers of the armed forces should undertake more treatment than they do at present so that civil hospitals, working under E.M.S. arrangements but with staffs depleted to supply the Services, may be relieved of some of the Service work, which is of a trivial character, which is sent to them at present, as this prevents them from carrying out their duties to the civil population properly.

He instanced cases of small sebaceous cysts, cut fingers not involving tendons or nerves, haemorrhoids, and varicose veins, which might well be treated by private officers.

Major-General Leslie said that where trivial cases were sent to hospital the matter should be referred to the regional hospital officer, who would bring it to the attention of the A.D.M.S. concerned. But with regard to some of these complaints the Army had not the facilities for treating varicose veins by the injection method, and they lacked the necessary nursing facilities to deal with the cases after the minor surgery had been undertaken.

It was agreed, on an amendment by Prof. Picken, to make representations to the Medical Directors of the fighting Services that the medical officers should be allowed and encouraged to undertake more treatment than they did at present so as to relieve civil hospitals working under E.M.S. arrangements.

Other Business

The Council learned with regret of the death of Mr. S. Coulson, former chief clerk in the Medical Department of the Association, who, until his serious illness which started some years ago, did very efficient work, in particular in the earlier stages of National Health Insurance. His services were often acknowledged by Mr. Alfred Cox and by the present Secretary, and he was said to know more about the Insurance Acts and Regulations than any man inside or outside the government service.

It was reported that on Oct. 23 the Association membership stood at a new high record—namely, 44,558, compared with 41,828 seven months ago. Prof. Picken said that this figure was most gratifying. Remarks were made by people who had other interests to further that the B.M.A. membership was not representative of the profession, as it would be surprised if the membership did not represent well over 80% of the practising doctors on the British Register.

Dr. O. C. Carter was welcomed on his first appearance as chairman of the Journal Committee. On the recommendation of that Committee the appointment of Dr. Donald Hunter as editor-in-chief of the forthcoming *British Journal of Industrial Medicine*, in place of Sir Henry Bashford, who was unable to continue to act as such, was approved. Dr. Carter

said that the committee wished to assure the Council that the importance of adequate publicity for medico-political matter in the *British Medical Journal* was fully appreciated, and that steps would be taken to meet the wishes of the Representative Body and the Panel Conference.

Dr. Dain presented the report of the Public Relations Committee. He said that the development of this work was proceeding very satisfactorily. Divisions had set up committees and had made useful contacts. The committee was anxious to be of service to any Division in this respect. Dr. I. D. Grant and Dr. Martin Brodie said that the work of the Public Relations Committee was much appreciated in Scotland.

CHANGING MEDICINE*

BY

TOM GARLAND, M.D.

We are living in such a welter of change affecting our profession that I feel there is a need to review the position not only in respect of actual changes that are taking place but in a more abstract way as well. We could spend the whole time merely analysing the shake-up that the war has already brought about in the sphere of our work. The changes have varied from trivial matters, such as the use of an English seed and gigantic agar-agar, to the sudden and gigantic eruption at the beginning of the war that produced within a few weeks 190,000 empty beds for the number of doctors in time in history or given service has been a given locality or in proportion to need. Extremely important changes affecting the whole status of the nursing profession have resulted from the Rushcliffe reports and the Nurses Act, 1943. Tremendous developments have occurred in the prevention of illness, particularly in the distribution of food to infants and children. On five days a week now three-quarters of a million children sit down to dinner at school and 3½ millions receive an extra ration of cheap or free milk at school, and there is a further supply of cheap milk to mothers and infants. It must be closely related to this and enormously significant that in 1942 the infantile mortality rate of 49 was the lowest ever recorded and the mortality of children of pre-school ages 1-5 was 2% lower in 1942 than the previous low record of 1939. At long last over half the child population 0-15, numbering about 8½ millions, have been immunized against diphtheria.

Resistance to Change

The mention of diphtheria brings to my mind the violent controversy that is associated with change. Most doctors will have been infuriated at the enormous expenditure of labour and material that has obviously gone in placarding the country with huge posters denouncing diphtheria immunization. However, the success of the immunization campaign emphasizes that this opposition is largely overcome. When we analyse, however, the district by district, we find that the acceptance of immunization for those needing it varies from over 90% in a district like Hornsey to 30% in certain other districts.

These differences reflect the varying power of the forces pushing for immunization, as opposed to those resisting it. This is a phenomenon that cannot be too closely examined. We must realize that to effect change the forces that oppose the change or profit by the *status quo* must be overcome. All the big names associated with combating disease—Semmelweis, Chadwick, Florence Nightingale, Lister—are also associated with epic battles that had to be fought and won before changes were established. We can see conflicts arising over minor matters daily: whether floors shall be polished or oiled; whether a nurses' council shall be established; whether medical committees shall overrule hospital superintendents; and we well know that quite startling changes sometimes develop over trivial changes.

It is necessary to emphasize this association of change with conflict, because so often when we try to mobilize support for some change, the reason given for not participating in the effort is that we shall provoke opposition. Let us appreciate that it is impossible to contemplate change of any importance that won't upset someone. In planning change we do need to assess what forces will oppose or obstruct, not in order to weigh up and defeat the opposition. In our own profession we have a particularly rich heritage of men and women who have effected change in the face of opposition. Health, moreover, is of such universal interest and application that a big issue in this sphere is a matter upon which none can remain neutral. Not to assist the progressive side makes it all the easier for the obstructors to claim that the progress is not wanted.

We know well as doctors that upon the health of an individual depend all manner of other personal characteristics—his temperament, initiative, courage, and even honesty and kindness of heart. Change a man's health and all manner of related features also change. Any single change, in fact, cannot be isolated. It is to this obvious fact that we must look to-day for an explanation of the tremendous stirrings that herald big changes in the organization of health services. A major war is itself a gigantic struggle between forces trying to effect or resist changes. To mobilize bigger and bigger forces in the main conflict all manner of related changes have to be effected; the tempo of change everywhere quickens: this is inevitable and quite understandable. It is inevitable no longer be necessary for us to ask, "Why must we wait for a war?" etc. We don't have to wait for a war; but war does hasten changes, some good, some bad.

A particularly important force to mobilize in war is one which is termed morale—a term hard to define exactly, but which can be taken in part at least to mean a mental attitude that adjusts the person to accept willingly, and even enthusiastically, the hardships and sacrifices entailed by war. One important way of doing this is to offer compensations in the future for these sacrifices. This might be taken as the positive line: the negative line would be to rouse fear of the future that would follow defeat. Now all men, including doctors, value security, and, as members of the Forces and civilians ask, "For what are we fighting?" a valuable aid to morale is to offer greater social security in the

* An abridged version of the Chairman's address at the annual general meeting of the Medical Society.

future. The Beveridge plan and its timing have to be understood like this: it is not "just a political ramp," Beveridge rightly sees the need for associated change in health services, employment, family allowances, etc. I think that doctors, with the intensity of interest and the fulness of satisfaction that may lie in their work, need to be warned against "sticking too closely to their last." When advocating a change in nutrition, we must appreciate its relation to family allowances, or to wages, and the relation of these in their turn to methods of production, the national economic system, and even international tariffs. Thus, when we come to assess the value of any particular change, the more we have studied and the better we are informed upon closely related, and even distantly related, changes, the better we are likely to be able to assess the amount of our energies we should direct to promoting or resisting that particular change.

Gradualness of Revolution

Finally, I would like to say a word about the much-favoured slogan "evolution not revolution." From many discussions I think it implies a fear that changes will be too drastic, too sudden, or, as it is often expressed, too revolutionary. Many people, including doctors, are fond of stating that they are in favour of gradual change, implying almost that automatically they would oppose sudden change. It is necessary to establish that this may lead to an almost unconsciously obstructive attitude, for change cannot always remain gradual. We can find many examples of this from our clinical experience. The tension of a cell can only increase gradually for a certain time before the wall bursts; the bowel is a relatively sudden change, "stretching" its wall, relatively suddenly, to accommodate the bursting aneurysm, the infectious haemophysis, and a host of other examples can be quoted. Our very birth is a relatively sudden change, occurring long and gradual foetal growth; death also. Wherever one watches change, if progress is maintained, one sees the inevitability of coming to this breaking point. The date upon which numbers of pensionable casualty cases appearing for medical adjudication. The lessons learned from the last war show this adjudication to be an intricate and responsible business, requiring doctors who have had experience in this work and at least 10 years of civil general practice. No two cases are quite alike, and it must be remembered that the country owes a debt to each soldier or sailor to see that his future earning capacity shall be maintained at normal level. Up to the present the selection of medical appraisers has not been on any definite plan; rather has it been a matter of personal selection by locally appointed pension officers. The Ministry of Pensions will no doubt turn to central medical authority for doctors possessing the best qualifications. We should therefore be prepared to respond with an organized scheme conceived on sound lines. The medical recruitment boards have done their work satisfactorily, and it is from this source that examiners for the Ministry of Pensions should not be difficult. In every large city or centre to the Ministry of Pensions should not
